Abstract

This thesis contains methods of finding new presentations of finite groups, particularly nonabelian simple groups. We have presented several progenitors such as $2^*10 : D_{10}$, $2^*8 : \mathbb{Z}_4 \wr \mathbb{Z}_2$, $3^*3 : m L_2(3)$, $2^*7 : L_2(7)$, $2^*4 : [2 : 2^2]$, $2^*11 : D_{11}$ and many more on which we’ve found the mathieu group $M_{12}$, and $2^*[M_{21} : 2^2]$ among their homomorphic images. We give the full monomial automorphism groups of $\text{Aut}(3^*2)$, $\text{Aut}(3^*3)$, and $\text{Aut}(5^*2)$. Included is a proof showing that the full monomial automorphism group of $\text{Aut}(m^*n)$ is isomorphic to $U(m) \wr S_n$. In addition we have constructed the Cayley Diagrams of $PGL_2(7)$, $[3 \times A_5] : 2$, $3 : [A_6 : 2]$, and $2 \times [(3 \times L_2(11)) : 2]$ using the process of double coset enumeration.
Acknowledgements

I would like to express my sincere gratitude and appreciation to Dr. Zahid Hasan, my advisor for this thesis. Thank you for your diligence, wisdom, patience and encouragement. You have positively influenced my academic career throughout my undergraduate and graduate years at CSUSB. I would also like to thank my committee members Dr. J. Paul Vicknair and Dr. Belisario Ventura. Both of you have helped me in different ways to reach my goals as an undergraduate and graduate student. To my fellow graduates, Kevin Baccari, Leonard Lamp, and Dustin Grindstaff, thank you all so much for your assistance over the last two years.

And to my family, thank you for always believing in me and never letting me give up. I couldn’t have succeeded without you. A special thank you to David Gomez for sharing his knowledge and experience with me, but most especially for his love, guidance, and unwavering support. There are no words to fully express how much love and appreciation I have for you all.

Introduction

A fundamental objective of group theory is to find and classify all finite simple groups. The composition factors of a finite group allow us to view our group as a product of its simple subgroups. By solving the extension problem we are able to find a homomorphic image of the finite group. By completing the double coset enumeration of a finite group we are able to construct the finite homomorphic image of the group by finding all of its double cosets and forming its Cayley Diagram. To find finite simple groups we write presentations for progenitors and factor those progenitors by relations. There are various techniques for writing the presentation for a progenitor of which we discuss in detail in later chapters. A few methods we highlight in this thesis include wreath product progenitors, transitive progenitors, and monomial progenitors. Once we write the progenitors we add relations to each and find their homomorphic images.

The process of finding these progenitors and homomorphic images was made possible with the aid of MAGMA Computational Algebra System, [?]. MAGMA is a large software package that performs computational algebra, number theory, algebraic geometry, and algebraic combinatorics. Its mathematically rigorous environment allows us to define and work with group structures necessary for our field of research.

We begin Chapter 1 providing key theorems and definitions that are used throughout this thesis. In Chapter 2 we first discuss the process of Double Coset Enumeration resulting in the construction of an isomorphic image of the Cayley Diagram. Chapter 3 tackles the extension problem in which we look at a group’s composition factors and find the group’s isomorphic type. In Chapter 4 we describe the process of creating Wreath Product progenitors, adding in relations and the resulting finite non-abelian simple groups. Next we explore Monomial Progenitors in Chapter 5 and prove that the full automorphism group of $m^{*n}$ is the wreath product $U(m) \wr S_n$. In Chapter
6 we show how we construct Monomial progenitors. Similarly, in Chapter 7 we describe
the process of creating Transitive progenitors. Finally, in Chapter 8 we list additional
progenitors that we have found over the course of our research and their tables of simple
groups.
Chapter 1

Preliminaries

Before we can begin to discuss the process of our work and our findings we must first discuss the preliminaries. In this chapter we will focus on definitions and theorems used in this thesis.

Definition 1.1 (Permutation). If $X$ is a nonempty set, a permutation is the bijective mapping $f : X \rightarrow X$.

Definition 1.2 (Symmetric Group). The symmetric group, denoted $S_n$ is the the set of all permutations of the nonempty set $X = \{1, 2, ..., n\}$. $S_n$ is a group of order $n!$ on $n$ letters.

Definition 1.3 (Disjoint). Two permutations $\alpha, \beta \in S_X$ are disjoint if every $x$ moved by one is fixed by the other. In symbols,

$$
\text{if } \alpha(a) \neq \beta(a) = a, \text{ and if } \alpha(b) = b, \text{ then } \beta(b) \neq b.
$$

Theorem 1.4. Every permutation of $S_n$ for $n \geq 2$ is a product of disjoint cycles.

Theorem 1.5. Let $\alpha \in S_X$, $\alpha$ is either a cycle or a product of disjoint cycles. [{?}]

Definition 1.6 (Homomorphism). Let $G$ and $H$ be groups. The mapping $\phi : G \rightarrow H$ is said to be a homomorphism if $\forall a, b \in G$

$$
\phi(ab) = \phi(a)\phi(b)
$$

Definition 1.7 (Isomorphism). Let $G$ and $H$ be groups. The mapping $\phi : G \rightarrow H$ is said to be an isomorphism if the following are true.
1. \( \phi \) is a homomorphism

2. \( \phi \) is one-to-one

3. \( \phi \) is onto

**Definition 1.8** (Conjugate). Let \( G \) be a group and \( a \in G \). For some \( g \in G \), \( g^{-1}ag \) is a conjugate of \( a \).

**Definition 1.9** (Simple). A group \( G \) is simple if it’s only normal subgroups are 1 and \( G \) itself.

**Definition 1.10** (Normal Subgroup). Let \( H \) be a subgroup of \( G \). We say \( H \) is a normal subgroup in \( G \), denoted \( H \trianglelefteq G \), if \( \forall g \in G \)

\[ g^{-1}Hg = H \]

**Theorem 1.11** (First Isomorphism Theorem). Let \( \phi : G \to H \) be a homomorphism with kernel \( K \). Then the following are true.

1. \( K \trianglelefteq G \)

2. \( G/K \cong \text{im } \phi \)

**Theorem 1.12** (Second Isomorphism Theorem). Let \( H \) and \( K \) be subgroups of \( G \), where \( H \) is normal. Then the following are true.

1. \( H \cap K \trianglelefteq K \)

2. \( K/(H \cap K) \cong HK/H \)

**Definition 1.13** (Order). Let \( G \) be a group. The order of \( G \) is the number of elements in \( G \), denoted \( |G| \).

**Definition 1.14** (Semi-Direct Product). The semi-direct product is \( p^*n : N \) where \( p^*n \) denotes a free product of \( n \) copies of the cyclic group of order \( p \) and \( N \) is a transitive permutation group of degree \( n \) which permutes the \( n \) generators of the cyclic groups by conjugation. \( ? \)
Definition 1.15 (Progenitor). A member of a family of infinite groups, the members of which include among their homomorphic images all the non-abelian simple groups, is called a progenitor. 

Definition 1.16 (Automorphism). An isomorphism \( \phi : G \to G \) is called an automorphism of \( G \).

Definition 1.17 (Complement). Let \( Q \) be a group and normal in \( G \). The subgroup is a complement of \( K \) in \( G \) if

1. \( G = QK \)
2. \( K \cap Q = 1 \)

Theorem 1.18 (Feit-Thompson Theorem). Every simple group is generated by involutions (elements of order 2).
Chapter 2

Double Coset Enumeration

2.1 Preliminaries

The semi-direct product $p^n : N$ is a progenitor of infinite order. We add relations to a progenitor to factor the group to find finite homomorphic images of $p^n : N$. Double Coset Enumeration is the process used to construct these images. This chapter will provide several examples of how we apply the process to our progenitors.

Definition 2.1 (Right Coset). Let $K$ be a subgroup of $G$ and $h \in G$. A right coset of $K$ in $G$ is the subset of $G$ defined as

$$Kh = \{kh|k \in K\},$$

where $h$ is a representative of $Kh$.

Definition 2.2 (Double Coset). Let $H$ and $K$ be subgroups of $G$. Then we define a double coset of $G$ as

$$HgK = \{Hgk|k \in K, g \in G\}.$$

We note that every double coset is composed of single cosets and $G$ is the union of all double cosets of $G$.

Definition 2.3 (Stabiliser). The stabiliser of $w$ in $N$, where $w$ in a word of $t_i$’s is given by

$$N^w = \{n \in N|w^n = w\}.$$
Definition 2.4 (Coset Stabiliser). The coset stabiliser of \( w \) in \( Nw \), where \( w \) is a word of \( t_i \)'s is given by

\[
N^{(w)} = \{ n \in N | Nw^n = Nw \}.
\]

We note that \( N^w \leq N^{(w)} \).

Definition 2.5 (G-Orbit). Let \( x \in X \). The set \( X^G = \{ x^g | g \in G \} \) is the G-orbit.

To complete the double coset enumeration we seek all the double cosets in \( G \) since \( G \) is equal to the union of all double cosets in \( G \). The size of each double coset is based on the number of unique single cosets contained in the double coset. The number of single cosets contained in a double coset can be found by \( \frac{|N|}{|N^{(w)}|} \), where \( N^{(w)} = \{ n \in N | Nw^n = Nw \} \) is the coset stabiliser. Then we select a representative \( t_i \) from each orbit of the double coset \( Nw \) on \( \{1, 2, ..., n\} \) and see which double coset contains \( Nwt_i \). Once the set of right cosets is closed under right multiplication we have no new double cosets and the process of double coset enumeration has been completed.

We can then form our Cayley Diagram for the progenitor.

2.2 Double Coset Enumeration of \( A_5 \) over \( S_3 \)

Consider the group \( G = \frac{2^{*3} : S_3}{[[312]t_3^5], [[31]t_3^5]} \cong A_5 \), where \( G \) is the homomorphic image of the infinite semi-direct product of the progenitor \( 2^{*3} : S_3 \) factored by the relations \([[(312)t_3]^5, [(31)t_3]^5]\). We have \( 2^{*3} = \langle t_1 \rangle \ast \langle t_2 \rangle \ast \langle t_3 \rangle \), where the \( t_i \)'s are of order 2. We note that \( S_3 = \langle (1, 2, 3), (1, 2) \rangle \). Let \( x = (1, 2, 3) \) and \( y = (1, 2) \).

First we must study our relation \([3, 1, 2]t_3^5 = e\).
Let $\pi = (312)$, then
\[
\begin{align*}
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^{-1} t_3 \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e \\
\pi t_3 \pi t_3 \pi t_3 \pi t_3 \pi t_3^2 (t_3) \pi t_3 &= e
\end{align*}
\] (2.1) (2.2) (2.3) (2.4) (2.5) (2.6) (2.7) (2.8) (2.9) (2.10)

We know $\pi = (3, 1, 2)$.
\[
\Rightarrow \pi^2 = (3, 1, 2)(3, 1, 2) = (3, 2, 1)
\]
\[
\Rightarrow \pi^3 = e
\]
\[
\Rightarrow \pi^4 = (3, 1, 2)
\]
\[
\Rightarrow \pi^5 = (3, 2, 1)
\]

Then our relation is $(3, 2, 1)t_3^5 t_3^4 t_3^3 t_3^2 (t_3) \pi t_3 = e$.
\[
\Rightarrow (3, 2, 1)t_3^{-1}(3, 1, 2)t_3^4 e^{t_3(3, 2, 1)} t_3^3 (3, 1, 2) t_3 = e
\]
\[
\Rightarrow (3, 2, 1)t_1 t_3 t_2 t_1 t_3 = e
\]
\[
\Rightarrow (3, 2, 1)t_1 t_3 t_2 = t_3 t_1
\]
Thus $(3, 2, 1)t_1 t_3 t_2 = t_3 t_1$ is our first relation.

Similarly we will study our second relation $[(3, 1)t_3]^5$. $[(3, 1)t_3]^5 = e$.

Let $\pi = (3, 1, 2)$, then following the same process as above we find the relation to be
\[
\pi^5 t_3^4 t_3^3 t_3^2 (t_3) \pi t_3 = e
\]

However, now we have $\pi = (3, 1)$.
\[
\Rightarrow \pi^2 = e
\]
\[
\Rightarrow \pi^3 = (3, 1)
\]
\[
\Rightarrow \pi^4 = e
\]
\[ \pi^5 = (3,1) \]

Then our relation is \((3,1)t^3_3 t^3_3 t^3_3 t^2_3 t_3 = e.\)

\[ \Rightarrow (3,1)t_3 e t_3 (3,1) t_3 \]

\[ \Rightarrow (3,1)t_3 t_1 t_3 t_3 = e \]

\[ \Rightarrow (3,1)t_3 t_1 t_3 = t_3 t_1 \]

Thus \((3,1)t_3 t_1 t_3 = t_3 t_1\) is our second relation.

Now we will perform the double coset enumeration of \(G\) over \(N\). Let us first consider the double coset containing the identity \(e\). We note that \(NeN = \{NeN|n \in N\} = \{Nn|n \in N\} = \{N\}.\) Let \([\ast]\) represent the double coset \(NeN\) which contains the single coset \(N\). The orbit of \(N\) on \(\{1,2,3\}\) is \(\{1,2,3\}\). We select a representative from our orbit, say \(3\), and determine which double coset contains \(Nt_3\).

Now \(Nt_3 \in Nt_3 N\) which is a new double coset. Let \([3]\) denote the new double coset. Now we must consider the coset stabilizer of \(N(3)\). \(N(3) = \langle (1, 3), (1, 2) \rangle\). The number of single cosets in \([3]\) can be found by \(\frac{|N|}{|N(3)|} = \frac{6}{2} = 3.\) The single cosets found within the double coset \([3]\) are \(\{Nt_1, Nt_2, Nt_3\}\). The orbits of \(N(3)\) on \(\{1,2,3\}\) are \(\{1,2\}\) and \(\{3\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1,2\}\) and \(3 \in \{3\}\). We note that \(Nt_3 t_3 = Nt_3^2 = Ne = N \in [\ast]\) and \(Nt_3 t_1\) belongs to a new double coset. Let \([31]\) denote the new double coset to which \(Nt_3 t_1\) belongs. Since we know \(1\), and \(2\) are in the same orbit of \(N(3)\) on \(\{1,2,3\}\), \(Nt_3 t_2 \in Nt_3 t_1 = [31]\).

Now we must consider the coset stabilizer of \(N(31)\). \(N(31) = \langle Id(N) \rangle\). The number of single cosets in \([31]\) can be found by \(\frac{|N|}{|N(31)|} = \frac{6}{1} = 6.\) The single cosets found within the double coset \([31]\) are \(\{Nt_1 t_2, Nt_2 t_1, Nt_1 t_3, Nt_3 t_1, Nt_3 t_2, Nt_2 t_3\}\). The orbits of \(N(31)\) on \(\{1,2,3\}\) are \(\{1\}\), \(\{2\}\), and \(\{3\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(2 \in \{2\}\), and \(3 \in \{3\}\). We note that \(Nt_3 t_1 t_1 = Nt_3 t_1^2 = Nt_3 \in [3]\). Now \(Nt_3 t_1 t_2 = Nt_3 t_1 \in [31]\) by our first relation and \(Nt_3 t_1 t_3 = Nt_3 t_1 \in [31]\) by our second relation. Thus we have no new double cosets and we can now construct the following Cayley Diagram.
2.3 Double Coset Enumeration of $PGL_2(7)$ over $S_4$

Consider the group $G = \frac{2^* S_4}{[t_1 t_2 t_1 t_2 = (3, 4)]} \cong PGL_2(7)$, where $G$ is the homomorphic image of the infinite semi-direct product of the progenitor $2^* S_4$ factored by the relation $[t_1 t_2 t_1 t_2 = (3, 4)]$. We have $2^* = \langle t_1 \rangle * \langle t_2 \rangle * \langle t_3 \rangle * \langle t_4 \rangle$, where the $t_i$s are of order 2. We note that $S_4 = \langle (1, 2, 3, 4), (1, 2) \rangle$. Let $x = (1, 2, 3, 4)$ and $y = (1, 2)$.

Now we will perform the double coset enumeration of $G$ over $N$. Let us first consider the double coset containing the identity $e$. We note that $NeN = \{Nen| n \in N\} = \{Nn| n \in N\} = \{N\}$. Let $[\ast]$ represent the double coset $NeN$ which contains the single coset $N$. The orbit of $N$ on $\{1, 2, 3, 4\}$ is $\{1, 2, 3, 4\}$. We select a representative from our orbit, say 1, and determine which double coset contains $Nt_1$.

Now we must consider the coset stabilizer of $N(1)$. $N(1) = \langle (2, 3, 4), (2, 3) \rangle \cong S_3$. The number of single cosets in $[1]$ can be found by $\frac{|N|}{|N(1)|} = \frac{24}{6} = 4$. The single cosets found within the double coset $[1]$ are $\{Nt_1, Nt_2, Nt_3, Nt_4\}$. The orbits of $N(1)$ on $\{1, 2, 3, 4\}$ are $\{1\}$ and $\{2, 3, 4\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}$ and $2 \in \{2, 3, 4\}$. We note that $Nt_1 t_1 = Nt_1^2 = Ne = N \in [\ast]$ and $Nt_1 t_2$ belongs to a new double coset. Let $[12]$ denote the new double coset to which $Nt_1 t_2$ belongs. Since we know 2, 3, and 4 are in the same orbit of $N(1)$ on $\{1, 2, 3, 4\}$, $Nt_1 t_3 \in Nt_1 t_2 = [12]$ and $Nt_1 t_4 \in Nt_1 t_2 = [12]$.

Now we must consider the coset stabilizer of $N(12)$. $N(12) = \langle (3, 4) \rangle$. The
number of single cosets in $[12]$ can be found by $\frac{\left|N\right|}{\left|N_{[12]}\right|} = \frac{24}{4} = 6$. The single cosets found within the double coset $[12]$ are $\{Nt_1t_2, Nt_2t_3, Nt_3t_4, Nt_3t_1, Nt_3t_2, Nt_4t_1\}$. The orbits of $N^{(12)}$ on $\{1, 2, 3, 4\}$ are $\{1, 2\}$ and $\{3, 4\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $2 \in \{1, 2\}$ and $3 \in \{3, 4\}$. We note that $Nt_1t_2t_2 = Nt_1t_2^2 = Nt_1 \in [1]$ and $Nt_1t_2t_3$ belongs to a new double coset. Let $[123]$ denote the new double coset to which $Nt_1t_2t_3$ belongs. Since 1 and 2 are in the same orbit of $N^{(12)}$ on $\{1, 2, 3, 4\}$, $Nt_1t_2t_1 \in Nt_1 = [1]$. Since 3 and 4 are in the same orbit of $N^{(12)}$ on $\{1, 2, 3, 4\}$, $Nt_1t_2t_4 \in Nt_1t_2t_3 = [123]$.

Now we must consider the coset stabilizer of $N^{(123)}$. $N^{(123)} = \langle (1, 2), (2, 3), (1, 2)(3, 4) \rangle$. The number of single cosets in $[123]$ can be found by $\frac{\left|N\right|}{\left|N_{[123]}\right|} = \frac{24}{8} = 3$. The single cosets found within the double coset $[123]$ are $\{Nt_1t_2t_3, Nt_2t_3t_4, Nt_2t_4t_1\}$. The orbit of $N^{(123)}$ on $\{1, 2, 3, 4\}$ is $\{1, 2, 3, 4\}$. Now we select a representative $t_i$ from the orbit and determine the double coset containing it. Let us select $3 \in \{1, 2, 3, 4\}$. We note that $Nt_1t_2t_3t_3 = Nt_1t_2t_3^2 = Nt_1t_2 \in [12]$. Since 1, 2, 3 and 4 are in the same orbit of $N^{(123)}$ on $\{1, 2, 3, 4\}$, $Nt_1t_2t_3t_1 \in Nt_1t_2 = [12]$ and $Nt_1t_2t_3t_2 \in Nt_1t_2 = [12]$ and $Nt_1t_2t_3t_4 \in Nt_1t_2 = [12]$. So we have no new double cosets and we can now construct the following Cayley Diagram.

\begin{figure}[h]
\centering
\begin{tikzpicture}
\node (1) at (0,0) [circle, draw] {1};
\node (2) at (2,0) [circle, draw] {4};
\node (3) at (4,0) [circle, draw] {6};
\node (4) at (6,0) [circle, draw] {3};
\draw (1) -- (2) node [midway, above] {4};
\draw (2) -- (3) node [midway, above] {3};
\draw (3) -- (4) node [midway, above] {2};
\draw (4) -- (1) node [midway, above] {1};
\end{tikzpicture}
\caption{Cayley Diagram of $PGL_2(7)$ over $S_4$}
\end{figure}

2.4 Double Coset Enumeration of $[3 \times A_5] : 2$ over $D_{10}$

Consider the group $G = \frac{\mathbb{Z}_{2^{10}}, D_{10}}{[x^2yt^7]^{3}, [xt^7]^{3}} \cong [3 \times A_5] : 2$, where $G$ is the homomorphic image of the infinite semi-direct product of the progenitor $2^{*10} : D_{10}$ factored by the relations $[x^2yt^7]^3, [xt^7]^3$. We have $2^{*10} = \langle t_1 \rangle \ast \langle t_2 \rangle \ast \langle t_3 \rangle \ast \langle t_4 \rangle \ast \langle t_5 \rangle \ast \langle t_6 \rangle \ast \langle t_7 \rangle$.
\( \langle t_8 \rangle * \langle t_9 \rangle * \langle t_{10} \rangle \), where the \( t_i \)'s are of order 2. We note that \( D_{10} = \langle (1, 2, 3, 4), (1, 2) \rangle \).

Let \( x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \) and \( y = (2, 10)(3, 9)(4, 8)(5, 7) \).

First we must study our relation \( [x^2yt^x]^3 = e \).

Let \( x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \) and \( y = (2, 10)(3, 9)(4, 8)(5, 7) \).

\[
(\pi t x)^3 = e \tag{2.11}
\]
\[
(\pi t_1 t_2)^3 = e \tag{2.12}
\]
\[
\pi t_1 t_2 \pi^t t_2 \pi t_1 t_2 = e \tag{2.13}
\]
\[
\pi t_1 t_2 \pi^t_1 t_2 \pi t_1 t_2 = e \tag{2.14}
\]
\[
\pi^3 t_1^2 t_2^2 t_1^t t_2 \pi^t t_2 t_1 t_2 = e \tag{2.15}
\]
\[
(\pi t_2)^3 = e \tag{2.16}
\]

We know \( \pi = (1, 9)(2, 8)(3, 7)(4, 6) \).

\[ \Rightarrow \pi^2 = e \]
\[ \Rightarrow \pi^3 = (1, 9)(2, 8)(3, 7)(4, 6) \]

Then our relation is \( (1, 9)(2, 8)(3, 7)(4, 6)t_1^t t_2^t t_1 t_2 = e \).

\[ \Rightarrow (1, 9)(2, 8)(3, 7)(4, 6)t_1 t_2 \pi t_1(1, 9)(2, 8)(3, 7)(4, 6)t_2 \pi(1, 9)(2, 8)(3, 7)(4, 6)t_1 t_2 = e \]
\[ \Rightarrow (1, 9)(2, 8)(3, 7)(4, 6)t_1 t_2 t_9 t_8 t_1 t_2 = e \]
\[ \Rightarrow (1, 9)(2, 8)(3, 7)(4, 6)t_1 t_2 t_9 = t_2 t_1 t_8 \]

Thus \( (1, 9)(2, 8)(3, 7)(4, 6)t_1 t_2 t_9 = t_2 t_1 t_8 \) is our first relation.

Similarly we will study our second relation \( [x^t]^3 \). \( [x^t]^3 = e \).

Let \( \pi = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \), then

\[
(\pi t x)^3 = e \tag{2.17}
\]
\[
(\pi t_2)^3 = e \tag{2.18}
\]
\[
\pi t_2 \pi t_2 \pi t_2 = e \tag{2.19}
\]
\[
\pi t_2 \pi^t_2 t_2 = e \tag{2.20}
\]
\[
\pi^3 t_2^t t_2 = e \tag{2.21}
\]

Now we have \( \pi = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \).
\[\Rightarrow \pi^2 = (1, 3, 5, 7, 9)(2, 4, 6, 8, 10)\]
\[\Rightarrow \pi^3 = (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)\]

Then our relation is \((1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_2^2 t_2 = e.\)
\[\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_2^{(1,3,5,7,9)(2,4,6,8,10)}t_2^{(1,2,3,4,5,6,7,8,9,10)}t_2 = e\]
\[\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4 t_2 = e\]
\[\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4 = t_2 t_3\]

Thus \((1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4 = t_2 t_3\) is our second relation.

Now we will perform the double coset enumeration of \(G\) over \(N\). Let us first consider the double coset containing the identity \(e\). We note that \(NeN = \{Nen|n \in N\} = \{N\}.\) Let \([\ast]\) represent the double coset \(NeN\) which contains the single coset \(N\). The orbit of \(N\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) is \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\). We select a representative from our orbit, say 1, and determine which double coset contains \(Nt_1\).

Now \(Nt_1 \in Nt_1 N\) which is a new double coset. Let \([1]\) denote the new double coset. Now we must consider the coset stabilizer of \(N^{(1)}\). \(N^{(1)} = \{e, (2, 10)(3, 9)(4, 8)(5, 7)\}\). The number of single cosets in \([1]\) can be found by \(\frac{|N|}{|N^{(1)}|} = \frac{20}{2} = 10\). The single cosets found within the double coset \([1]\) are \(\{Nt_1, Nt_2, Nt_3, Nt_4, Nt_5, Nt_6, Nt_7, Nt_8, Nt_9, Nt_{10}\}\). The orbits of \(N^{(1)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}, \{6\}, \{2, 10\}, \{3, 9\}, \{4, 8\}, \{5, 7\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\) and \(6 \in \{6\}\). We note that \(Nt_1 t_1 = Nt_1^2 = Ne = N \in [\ast]\) and \(Nt_1 t_6\) belongs to a new double coset. Let \([16]\) denote the new double coset to which \(Nt_1 t_6\) belongs. Similarly we find the double cosets \(Nt_1 t_2, Nt_1 t_3, Nt_1 t_4, \text{ and } Nt_1 t_5\). Upon further examination, through MAGMA we find that \(Nt_1 t_2 = Nt_1, Nt_1 t_4 = Nt_1, \text{ and } Nt_1 t_5 = Nt_1 t_3, \) which we will denote \([13]\).

Now we must consider the coset stabilizer of \(N^{(16)}\). \(N^{(16)} = \{e, (2, 10)(3, 9)(4, 8)(5, 7), (1, 3, 5, 7, 9)(2, 4, 6, 8, 10), (1, 3)(4, 10)(5, 9)(6, 8), (1, 9)(2, 8)(3, 7)(4, 6), (1, 9, 7, 5, 3)(2, 10, 8, 6, 4), (1, 5, 9, 3, 7)(2, 6, 10, 4, 8), (15)(2, 4)(6, 10)(7, 9), (1, 7, 3, 9, 5)(2, 8, 4, 10, 6), (1, 7)(2, 6)(3, 5)(8, 10)\}\). The number of single cosets in \([16]\) can be found by \(\frac{|N|}{|N^{(16)}|} = \frac{20}{10} = 2\). The orbits of \(N^{(16)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 3, 5, 7, 9\}\) and \(\{2, 4, 6, 8, 10\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1, 3, 5, 7, 9\}\).
and \(6 \in \{2, 4, 6, 8, 10\}\). We note that \(Nt_1t_6t_6 = Nt_1t_6^2 = Nt_1 \in [1]\) and \(Nt_1t_6t_1\) belongs to a new double coset. Let \([161]\) denote the new double coset to which \(Nt_1t_6t_1\) belongs. Since \(2, 4, 6, 8,\) and \(10\) are in the same orbit of \(N^\{16\}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(Nt_1t_6t_2, Nt_1t_6t_4, Nt_1t_6t_8,\) and \(Nt_1t_6t_{10} \in Nt_1 = [1]\). Since \(1, 3, 5, 7,\) and \(9\) are in the same orbit of \(N^\{16\}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(Nt_1t_6t_3, Nt_1t_6t_5, Nt_1t_6t_7,\) and \(Nt_1t_6t_9 \in Nt_1t_6t_1 = [161]\). Upon further examination, through MAGMA we find that \(Nt_1t_6t_1 = Nt_1t_3\), which we will denote \([13]\).

Now we must consider the coset stabilizer of \(N^\{13\}\). \(N^\{13\} = \{e, (2, 10)(3, 9) (4, 8)(5, 7), (1, 6)(2, 7)(3, 8)(4, 9)(5, 10), (1, 6)(2, 5)(3, 4)(7, 10)(8, 9)\}\). The number of single cosets in \([13]\) can be found by \(\frac{|N|}{|N^\{13\}|} = \frac{20}{4} = 5\). The orbits of \(N^\{13\}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 6\}, \{2, 5, 7, 10\}\) and \(\{3, 4, 8, 9\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1, 6\}, 2 \in \{2, 5, 7, 10\}\) and \(3 \in \{3, 4, 8, 9\}\). We note that \(Nt_1t_1t_3 = Nt_1t_3^2 = Nt_1 \in [1]\). Through MAGMA we find that \(Nt_1t_1t_3t_1 = Nt_1t_6\) and \(Nt_1t_3t_2 = Nt_1\). Since \(1\) and \(6\) are in the same orbit of \(N^\{13\}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(Nt_1t_1t_6 \in Nt_1t_6 = [16]\). Similarly, \(Nt_1t_3t_5, Nt_1t_3t_7, Nt_1t_3t_{10} \in Nt_1 = [1],\) and \(Nt_1t_3t_4, Nt_1t_3t_8, Nt_1t_3t_9 \in Nt_1t_2 = [12]\). So we have no new double cosets and we can now construct the Cayley Diagram as seen in figure ??.

### 2.5 Double Coset Enumeration of \([A_6 : 2]\) over \(D_{10}\)

Consider the group \(G = \frac{2^{10}:D_{10}}{[x^2yt_2^2]^3, [xt^2]^5, [tt^2t^2]^3]^{\infty} \cong 3 : [A_6 : 2]}\), where \(G\) is the homomorphic image of the infinite semi-direct product of the progenitor \(2^{10} : D_{10}\) factored by the relations \([x^2yt_2^2]^3, [xt^2]^5, [tt^2t^2]^3]^{\infty}\). We have \(2^{10} = \langle t_1 \rangle \ast \langle t_2 \rangle \ast \langle t_3 \rangle \ast \langle t_4 \rangle \ast \langle t_5 \rangle \ast \langle t_7 \rangle \ast \langle t_8 \rangle \ast \langle t_9 \rangle \ast \langle t_{10} \rangle\), where the \(t_i\)s are of order 2. We note that \(D_{10} = \langle (1, 2, 3, 4), (1, 2) \rangle\). Let \(x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)\) and \(y = (2, 10)(3, 9)(4, 8)(5, 7)\).
First we must study our relation \([x^2 y t t x]^3 = e\).

Let \(\pi = x^2 y = (1, 9)(2, 8)(3, 7)(4, 6)\), then

\[
\begin{align*}
(\pi t t x)^3 &= e \quad (2.22) \\
(\pi t_1 t_2)^3 &= e \quad (2.23) \\
\pi t_1 t_2 \pi t_1 t_2 \pi t_1 t_2 &= e \quad (2.24) \\
\pi t_1 t_2 \pi \pi^2 t_1 t_2 t_1 t_2 &= e \quad (2.25) \\
\pi^3 t_1^2 t_2^2 t_1 t_2 t_1 t_2 &= e \quad (2.26) \\
\pi^3 t_1^2 t_2^2 t_1 t_2 t_1 t_2 &= e \quad (2.27)
\end{align*}
\]

We know \(\pi = (1, 9)(2, 8)(3, 7)(4, 6)\).

\(\Rightarrow \pi^2 = e\)

\(\Rightarrow \pi^3 = (1, 9)(2, 8)(3, 7)(4, 6)\)

Then our relation is \((1, 9)(2, 8)(3, 7)(4, 6)t_1^2 t_2^2 t_1^2 t_2^2 t_1 t_2 = e\).

\(\Rightarrow (1, 9)(2, 8)(3, 7)(4, 6)t_1^2 t_2^2 t_1^2 t_2^2 t_1 t_2^2 t_1 t_2 = e\)
We have

\[ (1, 9)(2, 8)(3, 7)(4, 6)t_1t_2t_9t_8t_1 = e \]
\[ (1, 9)(2, 8)(3, 7)(4, 6)t_1t_2t_9 = t_2t_1t_8 \]

Thus \((1, 9)(2, 8)(3, 7)(4, 6)t_1t_2t_9 = t_2t_1t_8\) is our first relation.

Next we will study our second relation \([xt^x]^5 = e\).

We have \(x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)\), then

\[
(x^5)^5 = e \tag{2.28}
\]
\[
(xt^x)^5 = e \tag{2.29}
\]
\[
xt_2xt_2xt_2xt_2 = e \tag{2.30}
\]
\[
xt_2xt_2xt_2x^2t_2 = e \tag{2.31}
\]
\[
xt_2xt_2x^3t_2^2t_2 = e \tag{2.32}
\]
\[
xt_2x^4t_2^3t_2^2t_2 = e \tag{2.33}
\]
\[
x^5t_2^4t_2^3t_2^2t_2 = e \tag{2.34}
\]
\[
x^5t_2^4t_2^3t_2^2t_2 = e \tag{2.35}
\]

Now we have \(x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)\).

\[ x^2 = (1, 3, 5, 7, 9)(2, 4, 6, 8, 10) \]
\[ x^3 = (1, 4, 7, 10, 3, 6, 9, 2, 5, 8) \]
\[ x^4 = (1, 5, 9, 3, 7)(2, 6, 10, 4, 8) \]
\[ x^5 = (1, 6)(2, 7)(3, 8)(4, 9)(5, 10) \]

Then our relation is \((1, 6)(2, 7)(3, 8)(4, 9)(5, 10)t_2^4t_2^3t_2^2t_2 = e\).

\[ (1, 6)(2, 7)(3, 8)(4, 9)(5, 10)t_8t_5t_4t_3t_2 = e \]
\[ (1, 6)(2, 7)(3, 8)(4, 9)(5, 10)t_8t_5 = t_2t_3t_4 \]

Thus \((1, 6)(2, 7)(3, 8)(4, 9)(5, 10)t_8t_5 = t_2t_3t_4\) is our second relation.

Our final relation is \([tt^xt^x]^8 = [tt^xt^x]^8 = e\)

We have \(x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)\).

\[ x^3 = (1, 4, 7, 10, 3, 6, 9, 2, 5, 8) \]
\[ [tt^xt^x]^8 = [t_1t_2t_4]^8 \]
\[ [t_1t_2t_4]^8 = t_1t_2t_4t_1t_2t_4t_1t_2t_4t_1t_2t_4t_1t_2t_4t_1t_2t_4t_1t_2t_4 \]

Now we will perform the double coset enumeration of \( G \) over \( N \). Let us first consider the double coset containing the identity \( e \). We note that \( NeN = \{ Nn|n \in N \} = \{ nN|n \in N \} = \{ N \} \). Let \([*] \) represent the double coset \( NeN \) which contains the single coset \( N \). The orbit of \( N \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \) is \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \). We select a representative from our orbit, say 1, and determine which double coset contains \( Nt_1 \).

Now \( Nt_1 \in Nt_1N \) which is a new double coset. Let \([1] \) denote the new double coset. Now we must consider the coset stabilizer of \( N^{(1)} \). \( N^{(1)} = \{ e, (2, 10)(3, 9)(4, 8)(5, 7) \} \). The number of single cosets in \([1] \) can be found by \( \frac{|N|}{|N^{(1)}|} = \frac{20}{2} = 10 \). The single cosets found within the double coset \([1] \) are \( \{ Nt_1, Nt_2, Nt_3, Nt_4, Nt_5, Nt_6, Nt_7, Nt_8, Nt_9, Nt_{10} \} \). The orbits of \( N^{(1)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \) are \( \{1\}, \{6\}, \{2, 10\}, \{3, 9\}, \{4, 8\}, \{5, 7\} \). Now we must consider the coset stabilizer of \( Nt_1t_1 \) which contains the identity \( e \) and \( Nt_1t_6 \) belongs to a new double coset. Let \([16] \) denote the new double coset to which \( Nt_1t_6 \) belongs. Similarly we find the new double cosets \( Nt_1t_2, Nt_1t_3, Nt_1t_4, \) and \( Nt_1t_5 \), which we will denote \([12], [13], [14], \) and \([15] \) respectively.

Now we must consider the coset stabilizer of \( N^{(16)} \). \( N^{(16)} = \{ e, (2, 10)(3, 9)(4, 8)(5, 7), (1, 3, 5, 7, 9)(2, 4, 6, 8, 10), (1, 3)(4, 10)(5, 9)(6, 8), (1, 9)(2, 8)(3, 7)(4, 6), (1, 9, 7, 5, 3)(2, 10, 8, 6, 4), (1, 5, 9, 3, 7)(2, 6, 10, 4, 8), (15)(2, 4)(6, 10)(7, 9), (1, 7, 3, 9, 5)(2, 8, 4, 10, 6), (1, 7)(2, 6)(3, 5)(8, 10) \} \). The number of single cosets in \([16] \) can be found by \( \frac{|N|}{|N^{(16)}|} = \frac{20}{10} = 2 \). The orbits of \( N^{(16)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \) are \( \{1, 3, 5, 7, 9\} \) and \( \{2, 4, 6, 8, 10\} \). Now we select a representative \( t_i \) from each orbit and determine the double coset containing each \( t_i \). Let us select 1 \( \in \{1, 3, 5, 7, 9\} \) and 6 \( \in \{2, 4, 6, 8, 10\} \). We note that \( Nt_1t_6t_6 = Nt_1t_6^2 = Nt_1 \in [1] \) and \( Nt_1t_6t_1 \) belongs to a new double coset. Let \([161] \) denote the new double coset to which \( Nt_1t_6t_1 \) belongs. Since 2, 4, 6, 8, and 10 are in the same orbit of \( N^{(16)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \), \( Nt_1t_6t_2, Nt_1t_6t_4, Nt_1t_6t_8, \) and \( Nt_1t_6t_{10} \in Nt_1 = [1] \). Since 1, 3, 5, 7, and 9 are in the same orbit of \( N^{(16)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \), \( Nt_1t_6t_3, Nt_1t_6t_5, Nt_1t_6t_7, \) and \( Nt_1t_6t_9 \in Nt_1t_6t_1 = [161] \).

Now we must consider the coset stabilizer of \( N^{(13)} \). \( N^{(13)} = \{ e, (1, 10)(2, 9) \} \).
(3, 8)(4, 7)(5, 6). The number of single cosets in [13] can be found by \(|N|/|N^{(13)}| = \frac{20}{7} = 10.

The orbits of \(N^{(13)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 10\}, \{2, 9\}, \{3, 8\}, \{4, 7\}, \) and \(\{5, 6\}. \) Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i.\) Let us select \(1 \in \{1, 10\}, 2 \in \{2, 9\}, 3 \in \{3, 8\}, 4 \in \{4, 7\}, \) and \(5 \in \{5, 6\}.\) We note that \(N_{t_1}t_3t_3 = N_{t_1}t_3^2 = N_{t_1} \in [1].\) We note that \(N_{t_1}t_3t_2\) and \(N_{t_1}t_3t_4\) belong to new double cosets denoted [132] and [134] respectively. Through MAGMA we find that \(N_{t_1}t_3t_1 = N_{t_1}t_3\) and \(N_{t_1}t_3t_5 = N_{t_1}t_4.\) Since 1 and 10 are in the same orbit of \(N^{(13)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_1}t_3t_{10} \in N_{t_1}t_3 = [13].\) Similarly, \(N_{t_1}t_3t_9 \in [132], N_{t_1}t_3t_8 \in [13], N_{t_1}t_3t_7 \in [134], \) and \(N_{t_1}t_3t_6 \in [14].\)

Now we must consider the coset stabilizer of \(N^{(15)}, N^{(15)} = \{e, (1, 4)(2, 3) (5, 10)(6, 9)(7, 8)\}.\) The number of single cosets in [15] can be found by \(|N|/|N^{(15)}| = \frac{20}{7} = 10.\) The orbits of \(N^{(15)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 4\}, \{2, 3\}, \{5, 10\}, \{6, 9\}, \) and \(\{7, 8\}.\) Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i.\) Let us select \(1 \in \{1, 4\}, 2 \in \{2, 3\}, 5 \in \{5, 10\}, 6 \in \{6, 9\}, \) and \(7 \in \{7, 8\}.\) We note that \(N_{t_1}t_3t_5 = N_{t_1}t_3^2 = N_{t_1} \in [1]\) and \(N_{t_1}t_5t_7\) belongs to a new double coset denoted by [157]. Through MAGMA we see that \(N_{t_1}t_5t_2 = N_{t_1}t_3t_2 \in [132], \) and \(N_{t_1}t_5t_6 = N_{t_1}t_5 \in [15].\) Since 4 is in the same orbit of \(N^{(15)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_1}t_5t_4 \in [12].\) Similarly \(N_{t_1}t_5t_3 \in [132], N_{t_1}t_5t_10 \in [1], N_{t_1}t_5t_9 \in [15], N_{t_1}t_5t_8 \in [157].\)

Now we must consider the coset stabilizer of \(N^{(12)}, N^{(12)} = \{e\}.\) The number of single cosets in [12] can be found by \(|N|/|N^{(12)}| = \frac{20}{1} = 20.\) The orbits of \(N^{(12)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \) and \(\{10\}.\) Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i.\) Let us select \(1 \in \{1\}, 2 \in \{2\}, 3 \in \{3\}, 4 \in \{4\}, 5 \in \{5\}, 6 \in \{6\}, 7 \in \{7\}, 8 \in \{8\}, 9 \in \{9\}, \) and \(10 \in \{10\}.\) We note that \(N_{t_1}t_2t_2 = N_{t_1}t_3^2 = N_{t_1} \in [1].\) We see that \(N_{t_1}t_2t_1, N_{t_1}t_2t_3, N_{t_1}t_2t_4, N_{t_1}t_2t_5, N_{t_1}t_2t_6, N_{t_1}t_2t_7, N_{t_1}t_2t_8, N_{t_1}t_2t_9, \) and \(N_{t_1}t_2t_{10}\) belong to new double cosets. Through MAGMA we find that \(N_{t_1}t_2t_1 = N_{t_1}t_2 \in [12], N_{t_1}t_2t_3 = N_{t_1}t_2 \in [12], N_{t_1}t_2t_4 = N_{t_1}t_3t_7 \in [157], N_{t_1}t_2t_5 = N_{t_1}t_3t_4 \in [134], N_{t_1}t_2t_6 = N_{t_1}t_5 \in [15], N_{t_1}t_2t_7 = N_{t_1}t_6t_1 \in [161], N_{t_1}t_2t_8 = N_{t_1}t_2 \in [12], N_{t_1}t_2t_9 = N_{t_1}t_3t_4 \in [134], \) and \(N_{t_1}t_2t_{10} = N_{t_1}t_3t_2 \in [132].\)

Now we must consider the coset stabilizer of \(N^{(14)}, N^{(14)} = \{e\}.\) The number of single cosets in [14] can be found by \(|N|/|N^{(14)}| = \frac{20}{1} = 20.\) The orbits of \(N^{(14)}\) on
{1, 2, 3, 4, 5, 6, 7, 8, 9, 10} are \{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, and \{10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 \(\in\) \{1\}, 2 \(\in\) \{2\}, 3 \(\in\) \{3\}, 4 \(\in\) \{4\}, 5 \(\in\) \{5\}, 6 \(\in\) \{6\}, 7 \(\in\) \{7\}, 8 \(\in\) \{8\}, 9 \(\in\) \{9\}, and 10 \(\in\) \{10\}. We note that \(N t_1 t_4 t_4 = N t_1 t_4^2 = N t_1 \in [1]\). We see that \(N t_1 t_4 t_1, N t_1 t_4 t_2, N t_1 t_4 t_3, N t_1 t_4 t_5, N t_1 t_4 t_6, N t_1 t_4 t_7, N t_1 t_4 t_8, N t_1 t_4 t_9,\) and \(N t_1 t_4 t_{10}\) belong to new double cosets. Through MAGMA we find that \(N t_1 t_4 t_1 = N t_1 t_4 \in [14], N t_1 t_4 t_2 = N t_1 t_3 \in [13], N t_1 t_4 t_3 = N t_1 t_5 t_7 \in [157], N t_1 t_4 t_5 = N t_1 t_5 t_7 \in [157], N t_1 t_4 t_6 = N t_1 t_4 \in [14], N t_1 t_4 t_7 = N t_1 t_4 \in [14], N t_1 t_4 t_8 = N t_1 t_3 t_4 \in [134], N t_1 t_4 t_9 = N t_1 t_5 t_1 \in [161],\) and \(N t_1 t_4 t_{10} = N t_1 t_3 t_2 \in [132]\).

Now we must consider the coset stabilizer of \(N(132)\). \(N(132) = \{e, (2, 10)(3, 9)(4, 8)(5, 7)\}\). The number of single cosets in [132] can be found by \(\frac{|N|}{|N(132)|} = \frac{20}{2} = 10\). The orbits of \(N(132)\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{1\}, \{6\}, \{2, 10\}, \{3, 9, 4, 8\}, and \{7\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 \(\in\) \{1\}, 6 \(\in\) \{6\}, 2 \(\in\) \{2, 10\}, 3 \(\in\) \{3, 9\}, 4 \(\in\) \{4, 8\}, and 5 \(\in\) \{5, 7\}. We note that \(N t_1 t_3 t_2 t_2 = N t_1 t_3 t_2^2 = N t_1 t_3 \in [13]\). Through MAGMA we find that \(N t_1 t_3 t_2 t_1 = N t_1 t_5 t_7 \in [157], N t_1 t_3 t_2 t_6 = N t_1 t_3 t_4 \in [134], N t_1 t_3 t_2 t_3 = N t_1 t_5 \in [15], N t_1 t_3 t_2 t_4 = N t_1 t_2 \in [12], N t_1 t_3 t_2 t_5 = N t_1 t_4 \in [14].\) Since 2 and 10 are in the same orbit of \(N(132)\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N t_1 t_3 t_2 t_{10} = N t_1 t_5 t_7 \in [157]\). Similarly, \(N t_1 t_3 t_2 t_9 \in [15], N t_1 t_3 t_2 t_8 \in [12], N t_1 t_3 t_2 t_7 \in [14]\).

Now we must consider the coset stabilizer of \(N(157)\). \(N(157) = \{e, (1, 7)(2, 6)(3, 5)(8, 10)\}\). The number of single cosets in [157] can be found by \(\frac{|N|}{|N(157)|} = \frac{20}{2} = 10\). The orbits of \(N(157)\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{4\}, \{9\}, \{1, 7\}, \{2, 6\}, \{3, 5\}, and \{8, 10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 4 \(\in\) \{4\}, 9 \(\in\) \{9\}, 7 \(\in\) \{1, 7\}, 2 \(\in\) \{2, 6\}, 3 \(\in\) \{3, 5\}, and 8 \(\in\) \{8, 10\}. We note that \(N t_1 t_5 t_7 t_7 = N t_1 t_5 t_2^2 = N t_1 t_5 \in [15]\.\) Through MAGMA we find that \(N t_1 t_5 t_7 t_4 = N t_1 t_3 t_2 \in [132], N t_1 t_5 t_7 t_9 = N t_1 t_5 t_7 \in [157], N t_1 t_5 t_7 t_2 = N t_1 t_2 \in [12], N t_1 t_5 t_7 t_3 = N t_1 t_4 \in [14], N t_1 t_5 t_7 t_8 = N t_1 t_4 \in [14].\) Since 1 and 7 are in the same orbit of \(N(157)\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N t_1 t_5 t_7 t_1 = N t_1 t_5 \in [15]\.\) Similarly, \(N t_1 t_5 t_7 t_6 \in [12], N t_1 t_5 t_7 t_9 \in [14],\) and \(N t_1 t_5 t_7 t_{10} \in [14].\) So we have no new double cosets and we can now construct the following Cayley diagram.
2.6 Double Coset Enumeration of $2 \times [3 \times L_2(11) : 2]$ over $D_{10}$

Consider the group $\mathcal{G} = \frac{2^{*10} \cdot D_{10}}{(x^3, x^4)} \cong 2 \times [(3 \times L_2(11)) : 2]$, where $\mathcal{G}$ is the homomorphic image of the infinite semi-direct product of the progenitor $2^{*10} : D_{10}$ factored by the relations $[x^3, [t \cdot t^{-3}]^4]$. We have $2^{*10} = \langle t_1 \rangle * \langle t_2 \rangle * \langle t_3 \rangle * \langle t_4 \rangle * \langle t_5 \rangle * \langle t_6 \rangle * \langle t_7 \rangle * \langle t_8 \rangle * \langle t_9 \rangle * \langle t_{10} \rangle$, where the $t_i$s are of order 2. We note that $D_{10} = \langle (1, 2, 3, 4), (1, 2) \rangle$. Let $x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)$ and $y = (2, 10)(3, 9)(4, 8)(5, 7)$.

First we must study our relation $[x^5 t^5] = e$. 

Figure 2.4: Cayley Diagram of $3 : [A_6 : 2]$ over $D_{10}$
We have \( x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \), then

\[
(x^x)^3 = e \tag{2.36}
\]

\[
(x^2)^3 = e \tag{2.37}
\]

\[
x_{t_2x_t_2x_t_2} = e \tag{2.38}
\]

\[
x_{t_2x^2t_2} = e \tag{2.39}
\]

\[
x^3t_2^2x^2t_2 = e \tag{2.40}
\]

Now we have \( x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \).

\[
\Rightarrow x^2 = (1, 3, 5, 7, 9)(2, 4, 6, 8, 10)
\]

\[
\Rightarrow x^3 = (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)
\]

Then our relation is \( (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_2^2 = e \).

\[
\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_2(1,3,5,7,9)(2,4,6,8,10)t_2(1,2,3,4,5,6,7,8,9,10)t_2 = e
\]

\[
\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4t_2t_2 = e
\]

\[
\Rightarrow (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4 = t_2t_3
\]

Thus \( (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)t_4 = t_2t_3 \) is our first relation.

Our second relation is \( [t^x]_4^3 = e \).

We have \( x = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10) \).

\[
\Rightarrow x^3 = (1, 4, 7, 10, 3, 6, 9, 2, 5, 8)
\]

\[
\Rightarrow [t^x]_4^3 = [t_1t_2]_4^3
\]

\[
\Rightarrow [t_1t_2]_4^3 = t_1t_2t_1t_2t_1t_2t_1t_2t_1t_2
\]

Now we will perform the double coset enumeration of \( G \) over \( N \). Let us first consider the double coset containing the identity \( e \). We note that \( NeN = \{NeN|n \in N\} = \{Nn|n \in N\} = \{N\} \). Let \([\ast]\) represent the double coset \( NeN \) which contains the single coset \( N \). The orbit of \( N \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \) is \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} \).

We select a representative from our orbit, say 1, and determine which double coset contains \( Nt_1 \).

Now \( Nt_1 \in Nt_1N \) which is a new double coset. Let \([1]\) denote the new double coset. Now we must consider the coset stabilizer of \( N^{(1)} \). \( N^{(1)} = \{e, (2, 10)(3, 9)(4, 8) \)
The number of single cosets in $[1]$ can be found by $\frac{|N|}{|N([1])|} = \frac{20}{7} = 10$. The single cosets found within the double coset $[1]$ are $\{N_{t_1}, N_{t_2}, N_{t_3}, N_{t_4}, N_{t_5}, N_{t_6}, N_{t_7}, N_{t_8}, N_{t_9}, N_{t_{10}}\}$. The orbits of $N^{(1)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{6\}, \{2, 10\}, \{3, 9\}, \{4, 8\}$, and $\{5, 7\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}$ and $6 \in \{6\}$. We note that $N_{t_1}t_1 = N_{t_2}t_2 = Ne = N \in [\ast]$ and $N_{t_1}t_6$ belongs to a new double coset. Let $[16]$ denote the new double coset to which $N_{t_1}t_6$ belongs. Similarly we find the new double cosets $N_{t_1}t_3$, $N_{t_1}t_4$, and $N_{t_1}t_5$, which we will denote $[13]$, $[14]$, and $[15]$ respectively. Through MAGMA we find that $N_{t_1}t_2 = N_{t_1} \in [1]$.

Now we must consider the coset stabilizer of $N^{(13)}$. $N^{(13)} = \{e, (1, 6)(2, 5)(3, 4)(7, 10)(8, 9)\}$. The number of single cosets in $[13]$ can be found by $\frac{|N|}{|N([13])|} = \frac{20}{7} = 10$. The orbits of $N^{(13)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{6\}, \{2, 5\}, \{3, 4\}, \{7, 10\}$, and $\{8, 9\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1, 6\}$, $2 \in \{2, 5\}$, $3 \in \{3, 4\}$, $7 \in \{7, 10\}$, and $8 \in \{8, 9\}$. We note that $N_{t_1}t_3t_3 = N_{t_1}t_3^2 = N_{t_1} \in [1]$. We note that $N_{t_1}t_3t_1$, $N_{t_1}t_3t_7$, $N_{t_1}t_3t_8$ belong to new double cosets denoted $[131]$, $[137]$ and $[138]$ respectively. Through MAGMA we find that $N_{t_1}t_3t_2 = N_{t_1}t_4$. Since 6 is in the same orbit of $N^{(13)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $N_{t_1}t_3t_6 \in N_{t_1}t_3t_1 = [131]$. Similarly, $N_{t_1}t_3t_5 \in [14], N_{t_1}t_3t_4 \in [13], N_{t_1}t_3t_10 \in [137], N_{t_1}t_3t_9 \in [138]$.

Now we must consider the coset stabilizer of $N^{(14)}$. $N^{(14)} = \{e\}$. The number of single cosets in $[14]$ can be found by $\frac{|N|}{|N([14])|} = \frac{20}{7} = 20$. The orbits of $N^{(14)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}$, and $\{10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}$, $2 \in \{2\}$, $3 \in \{3\}$, $4 \in \{4\}$, $5 \in \{5\}$, $6 \in \{6\}$, $7 \in \{7\}$, $8 \in \{8\}$, $9 \in \{9\}$, and $10 \in \{10\}$. We note that $N_{t_1}t_4t_4 = N_{t_1}t_4^2 = N_{t_1} \in [1]$. We see that $N_{t_1}t_4t_1$, $N_{t_1}t_4t_2$, $N_{t_1}t_4t_7$, $N_{t_1}t_4t_9$, $N_{t_1}t_4t_{10}$ belong to new double cosets. Through MAGMA we find that $N_{t_1}t_4t_3 = N_{t_1}t_5 \in [15], N_{t_1}t_4t_5 = N_{t_1}t_3 \in [13], N_{t_1}t_4t_6 = N_{t_1}t_3t_1 \in [131]$, and $N_{t_1}t_4t_8 = N_{t_1}t_4 \in [14]$.

Now we must consider the coset stabilizer of $N^{(15)}$. $N^{(15)} = \{e, (1, 3)(4, 10)(5, 9)(6, 8)\}$. The number of single cosets in $[15]$ can be found by $\frac{|N|}{|N([15])|} = \frac{20}{7} = 10$. The orbits of $N^{(15)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{2\}, \{7\}, \{1, 3\}, \{4, 10\}, \{5, 9\}$ and $\{6, 8\}$. Now we select a representative $t_i$ from each orbit and determine the double coset.
containing each \(t_i\). Let us select 1 \(\in\{1, 3\}\), 2 \(\in\{2\}\), 7 \(\in\{7\}\), 4 \(\in\{4, 10\}\), 5 \(\in\{5, 9\}\), and 6 \(\in\{6, 8\}\). We note that \(N\{t_1t_5t_5 = N\{t_1^2 = N\{t_1 \in \{1\}\) and \(N\{t_1t_5t_2\) belongs to a new double coset denoted by \([152]\). Through MAGMA we see that \(N\{t_1t_5t_1 = N\{t_1t_3t_8 \in [138]\), \(N\{t_1t_5t_7 = N\{t_4t_2 \in [142]\), \(N\{t_1t_5t_4 = N\{t_1t_6 \in [16]\) and \(N\{t_1t_5t_6 = N\{t_1t_4 \in [14]\). Since 1 and 3 are in the same orbit of \(N^{(15)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N\{t_1t_5t_3 = N\{t_1t_3t_8 \in [138]\). Similarly \(N\{t_1t_5t_{10} = N\{t_1t_6 \in [16]\), \(N\{t_1t_5t_8 = N\{t_1t_4 \in [14]\).}

Now we must consider the coset stabilizer of \(N^{(16)}\). \(N^{(16)} = \{(e, (2, 10)(3, 9)(4, 8)(5, 7)\). The number of single cosets in \([16]\) can be found by \(\frac{|N|}{|N^{(16)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(16)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{1\}, \{6\}, \{2, 10\}, \{3, 9\}, \{4, 8\} and \{5, 7\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 \(\in\{1\}\), 6 \(\in\{6\}\), 2 \(\in\{2, 10\}\), 3 \(\in\{3, 9\}\), 4 \(\in\{4, 8\}\), and 5 \(\in\{5, 7\}\). We note that \(N\{t_1t_6t_6 = N\{t_1t_6^2 = N\{t_1 \in \{1\}\) and \(N\{t_1t_6t_1\) belongs to a new double coset. Let \([161]\) denote the new double coset to which \(N\{t_1t_6t_1\) belongs. Through MAGMA we see that \(N\{t_1t_6t_1 = N\{t_1t_6 \in [16]\), \(N\{t_1t_6t_3 = N\{t_1t_4t_9 \in [149]\), \(N\{t_1t_6t_4 = N\{t_1t_3t_8 \in [138]\) and \(N\{t_1t_6t_5 = N\{t_1t_5 \in [15]\). Since 2 and 10 are in the same orbit of \(N^{(16)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N\{t_1t_6t_{10} = N\{t_1t_6 \in [16]\). Similarly \(N\{t_1t_6t_9 = N\{t_1t_4t_9 \in [149]\), \(N\{t_1t_6t_8 = N\{t_1t_3t_8 \in [138]\), and \(N\{t_1t_6t_7 = N\{t_1t_5 \in [15]\).}

Now we must consider the coset stabilizer of \(N^{(131)}\). \(N^{(131)} = \{(e, \}\). The number of single cosets in \([131]\) can be found by \(\frac{|N|}{|N^{(131)}|} = \frac{20}{1} = 20\). The orbits of \(N^{(131)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, and \{10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 \(\in\{1\}\), 2 \(\in\{2\}\), 3 \(\in\{3\}\), 4 \(\in\{4\}\), 5 \(\in\{5\}\), 6 \(\in\{6\}\), 7 \(\in\{7\}\), 8 \(\in\{8\}\), 9 \(\in\{9\}\), and 10 \(\in\{10\}\). We note that \(N\{t_1t_3t_1t_1 = N\{t_1t_3t_1^2 = N\{t_1t_3 \in [13]\). We see that \(N\{t_1t_3t_1t_3, N\{t_1t_3t_4, N\{t_1t_3t_5, N\{t_1t_3t_6, N\{t_1t_3t_8\) belong to new double cosets. Let \([1313]\), \([1314]\), \([1315]\), \([1316]\), and \([1318]\) denote them respectively. Through MAGMA we find that \(N\{t_1t_3t_1t_2 = N\{t_1t_3t_7 \in [137]\), \(N\{t_1t_3t_1t_7 = N\{t_1t_4t_1 \in [141]\), \(N\{t_1t_3t_1t_3 = N\{t_1t_4t_7 \in [147]\), and \(N\{t_1t_3t_1t_{10} = N\{t_1t_4 \in [14]\).}

Now we must consider the coset stabilizer of \(N^{(137)}\). \(N^{(137)} = \{(e, (1, 7)(2, 6)(3, 5)(8, 10)\). The number of single cosets in \([137]\) can be found by \(\frac{|N|}{|N^{(137)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(137)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{4\}, \{9\}, \{1, 7\}, \{2, 6\}, \{3, 5\}, and \{8, 10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 4 \(\in\{4\}\), 9 \(\in\{9\}\), 7 \(\in\{1, 7\}\), 2 \(\in\{2, 6\},
3 ∈ \{3, 5\}, and 8 ∈ \{8, 10\}. We note that \(N_{t_1}t_3t_7t_7 = N_{t_1}t_3t_7^2 = N_{t_1}t_3 \in [13]\) and \(N_{t_1}t_3t_7t_4\) is a new double coset denoted \([1374]\). Through MAGMA we find that \(N_{t_1}t_3t_7t_5 = N_{t_1}t_3t_7t_3 \in \{1313\}\), \(N_{t_1}t_3t_7t_2 = N_{t_1}t_3t_8 \in \{138\}\), \(N_{t_1}t_3t_7t_3 = N_{t_1}t_3t_7t_5 \in [1315]\), \(N_{t_1}t_3t_7t_8 = N_{t_1}t_3t_1 \in [131]\). Since 1 and 7 are in the same orbit of \(N^{(137)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_1}t_3t_7t_1 = N_{t_1}t_3t_7 \in [137]\). Similarly, \(N_{t_1}t_3t_7t_6 \in [138]\), \(N_{t_1}t_3t_7t_5 \in [1315]\), and \(N_{t_1}t_3t_7t_10 \in [131]\).

Now we must consider the coset stabilizer of \(N^{(138)}\). \(N^{(138)} = \{e\}\). The number of single cosets in \([12]\) can be found by \(\frac{|N|}{|N^{(138)}|} = \frac{20}{1} = 20\). The orbits of \(N^{(138)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}\), \(\{2\}\), \(\{3\}\), \(\{4\}\), \(\{5\}\), \(\{6\}\), \(\{7\}\), \(\{8\}\), \(\{9\}\), and \(\{10\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(2 \in \{2\}\), \(3 \in \{3\}\), \(4 \in \{4\}\), \(5 \in \{5\}\), \(6 \in \{6\}\), \(7 \in \{7\}\), \(8 \in \{8\}\), \(9 \in \{9\}\), and \(10 \in \{10\}\). We note that \(N_{t_1}t_3t_8t_8 = N_{t_1}t_3t_8^2 = N_{t_1}t_3 \in [13]\) and \(N_{t_1}t_3t_8t_6\) is a new double coset denoted \([1386]\). Through MAGMA we find that \(N_{t_1}t_3t_8t_6^1 = N_{t_1}t_3t_8t_2 \in [152]\), \(N_{t_1}t_3t_8t_3 = N_{t_1}t_5 \in [15]\), \(N_{t_1}t_3t_8t_4 = N_{t_1}t_6 \in [16]\), \(N_{t_1}t_3t_8t_5 = N_{t_1}t_8 \in [138]\), \(N_{t_1}t_3t_8t_9 = N_{t_1}t_3t_{17} \in [137]\), and \(N_{t_1}t_3t_8t_{10} = N_{t_1}t_3t_{15} \in [1315]\).

Now we must consider the coset stabilizer of \(N^{(141)}\). \(N^{(141)} = \{e, \}\). The number of single cosets in \([141]\) can be found by \(\frac{|N|}{|N^{(141)}|} = \frac{20}{1} = 20\). The orbits of \(N^{(141)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}\), \(\{2\}\), \(\{3\}\), \(\{4\}\), \(\{5\}\), \(\{6\}\), \(\{7\}\), \(\{8\}\), \(\{9\}\), and \(\{10\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(2 \in \{2\}\), \(3 \in \{3\}\), \(4 \in \{4\}\), \(5 \in \{5\}\), \(6 \in \{6\}\), \(7 \in \{7\}\), \(8 \in \{8\}\), \(9 \in \{9\}\), and \(10 \in \{10\}\). We note that \(N_{t_1}t_4t_1t_1 = N_{t_1}t_4t_1^2 = N_{t_1}t_4 \in [14]\). We see that \(N_{t_1}t_4t_1t_3\), \(N_{t_1}t_4t_1t_4\), and \(N_{t_1}t_4t_1t_5\) belong to new double cosets. Let \([1413]\), \([1414]\), and \([1415]\) denote them respectively. Through MAGMA we find that \(N_{t_1}t_4t_1t_2 = N_{t_1}t_4t_1t_{10} \in [1410]\), \(N_{t_1}t_4t_1t_6 = N_{t_1}t_3t_1t_6 \in [1316]\), \(N_{t_1}t_4t_1t_7 = N_{t_1}t_3t_1 \in [131]\), \(N_{t_1}t_4t_1t_8 = N_{t_1}t_3t_1t_8 \in [1318]\), \(N_{t_1}t_4t_1t_9 = N_{t_1}t_3t_1t_4 \in [1314]\) and \(N_{t_1}t_4t_1t_{10} = N_{t_1}t_4t_2 \in [142]\).

Now we must consider the coset stabilizer of \(N^{(142)}\). \(N^{(142)} = \{e, (2, 10)(3, 9)(4, 8)(5, 7)\}\). The number of single cosets in \([142]\) can be found by \(\frac{|N|}{|N^{(142)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(142)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}\), \(\{6\}\), \(\{2, 10\}\), \(\{3, 9\}\), \(\{4, 8\}\) and \(\{5, 7\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(6 \in \{6\}\), \(2 \in \{2, 10\}\), \(3 \in \{3, 9\}\), \(4 \in \{4, 8\}\), and
5 ∈ \{5, 7\}. We note that \(N_{t_4}t_{2}t_2 = N_{t_4}t_{2}t_2^2 = N_{t_4}t_4 \in [14]\). Through MAGMA we see that \(N_{t_4}t_{2}t_1 = N_{t_1}t_{5}\), \(N_{t_4}t_{2}t_6 = N_{t_4}t_{2}t_2 = [142]\), \(N_{t_4}t_{2}t_3 = N_{t_4}t_1 \in [141]\), \(N_{t_4}t_{2}t_4 = N_{t_1}t_{3}t_{1}t_4 \in [1314]\) and \(N_{t_4}t_{2}t_5 = N_{t_1}t_{3}t_{1}t_8 \in [1318]\). Since 2 and 10 are in the same orbit of \(N^{(142)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_4}t_{2}t_{10} = N_{t_4}t_4 \in [14]\). Similarly \(N_{t_4}t_{2}t_9 = N_{t_4}t_{3}t_1 \in [141]\), \(N_{t_4}t_{2}t_8 = N_{t_3}t_{1}t_4 \in [1314]\), and \(N_{t_4}t_{2}t_7 = N_{t_3}t_{8}t_6 \in [1386]\).

Now we must consider the coset stabilizer of \(N^{(147)}\). \(N^{(147)} = \{e, (1, 2)(3, 10) \ (4, 9)(5, 8)(6, 7)\}\). The number of single cosets in [147] can be found by \(\frac{|N|}{|N^{(147)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(147)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 2\}, \{3, 10\}, \{4, 9\}, \{5, 8\}\) and \(\{6, 7\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 ∈ \(\{1, 2\}\), 3 ∈ \(\{3, 10\}\), 4 ∈ \(\{4, 9\}\), 5 ∈ \(\{5, 8\}\), and 7 ∈ \(\{6, 7\}\). We note that \(N_{t_4}t_4t_7t_1 = N_{t_4}t_4t_2 = N_{t_4}t_4 \in [14]\). Through MAGMA we see that \(N_{t_4}t_4t_7t_1 = N_{t_1}t_5t_2 \in [152]\), \(N_{t_4}t_4t_7t_3 = N_{t_4}t_3t_5 \in [1415]\), \(N_{t_4}t_4t_7t_4 = N_{t_3}t_3t_1 \in [1318]\), and \(N_{t_4}t_4t_7t_5 = N_{t_3}t_3t_8 \in [131]\). Since 1 and 2 are in the same orbit of \(N^{(147)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_4}t_4t_7t_2 = N_{t_4}t_5t_2 \in [152]\). Similarly \(N_{t_4}t_4t_7t_10 = N_{t_4}t_4t_1t_5 \in [1415]\), \(N_{t_4}t_4t_7t_9 = N_{t_3}t_3t_1t_8 \in [1318]\), \(N_{t_4}t_4t_7t_8 = N_{t_3}t_3t_1 \in [131]\), and \(N_{t_4}t_4t_7t_6 = N_{t_1}t_4 \in [14]\).

Now we must consider the coset stabilizer of \(N^{(149)}\). \(N^{(149)} = \{e, (1, 8)(2, 7) \ (3, 6)(4, 5)(9, 10)\}\). The number of single cosets in [149] can be found by \(\frac{|N|}{|N^{(149)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(149)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1, 8\}, \{2, 7\}, \{3, 6\}, \{4, 5\}\) and \(\{9, 10\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select 1 ∈ \(\{1, 8\}\), 2 ∈ \(\{2, 7\}\), 3 ∈ \(\{3, 6\}\), 4 ∈ \(\{4, 5\}\), and 9 ∈ \(\{9, 10\}\). We note that \(N_{t_4}t_9t_9 = N_{t_4}t_9 \in [14]\). Through MAGMA we see that \(N_{t_4}t_9t_1 = N_{t_4}t_1 \in [1410]\), \(N_{t_4}t_9t_2 = N_{t_3}t_1t_6 \in [1316]\), \(N_{t_4}t_9t_3 = N_{t_3}t_8 \in [138]\), and \(N_{t_4}t_9t_4 = N_{t_6} \in [16]\). Since 1 and 8 are in the same orbit of \(N^{(149)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_4}t_9t_8 = N_{t_4}t_10 \in [1410]\). Similarly \(N_{t_4}t_9t_7 = N_{t_3}t_1t_6 \in [1316]\), \(N_{t_4}t_9t_6 = N_{t_3}t_8 \in [138]\), \(N_{t_4}t_9t_5 = N_{t_6} \in [16]\) and \(N_{t_4}t_9t_10 = N_{t_4} \in [14]\).

Now we must consider the coset stabilizer of \(N^{(1410)}\). \(N^{(1410)} = \{e, (1, 5)(2, 4) \ (6, 10)(7, 9)\}\). The number of single cosets in [1410] can be found by \(\frac{|N|}{|N^{(1410)}|} = \frac{20}{2} = 10\). The orbits of \(N^{(1410)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{3\}, \{8\}, \{1, 5\}, \{2, 4\}, \{6, 10\}\), and \(\{7, 9\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset.
containing each $t_i$. Let us select $3 \in \{3\}$, $8 \in \{8\}$, $1 \in \{1, 5\}$, $2 \in \{2, 4\}$, $10 \in \{6, 10\}$, and $7 \in \{7, 9\}$. We note that $Nt_1t_2t_8t_{10} = Nt_1t_2t_8^2 = Nt_4 \in \{14\}$ and $Nt_4t_6t_7t_3$ is a new double coset denoted [14103]. Through MAGMA we see that $Nt_1t_4t_6t_8t_7 = Nt_1t_4t_1t_3 \in \{1413\}$, $Nt_1t_4t_1t_5 = Nt_1t_4t_9 \in \{149\}$, $Nt_1t_3t_1t_6 = Nt_1t_3t_1t_6 \in \{1316\}$, and $Nt_1t_4t_5t_7 = Nt_1t_4t_1 \in \{141\}$. Since 1 and 5 are in the same orbit of $N^{(1410)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $Nt_1t_4t_5t_9 = Nt_1t_4t_9 \in \{149\}$ Similarly $Nt_1t_4t_5t_4 = Nt_1t_3t_1t_6 \in \{1316\}$, $Nt_1t_4t_5t_6 = Nt_1t_4 \in \{14\}$, and $Nt_1t_4t_5t_9 = Nt_1t_4t_5 \in \{141\}$.

Now we must consider the coset stabilizer of $N^{(152)}$. $N^{(152)} = \{e, (1, 3)(4, 10)(5, 9)(6, 8)\}$. The number of single cosets in [152] can be found by $\frac{|N|}{|N^{(152)}|} = \frac{20}{2} = 10$. The orbits of $N^{(152)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{2\}$, $\{7\}$, $\{1, 3\}$, $\{4, 10\}$, $\{5, 9\}$, and $\{6, 8\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $2 \in \{2\}$, $7 \in \{7\}$, $1 \in \{1, 3\}$, $4 \in \{4, 10\}$, $5 \in \{5, 9\}$, and $6 \in \{6, 8\}$. We note that $Nt_1t_5t_2t_3 = Nt_1t_5t_2^2 = Nt_4 \in \{15\}$. Through MAGMA we see that $Nt_1t_5t_2t_7 = Nt_1t_5t_2 \in \{152\}$, $Nt_1t_5t_2t_1 = Nt_1t_3t_8 \in \{138\}$, $Nt_1t_5t_2t_4 = Nt_1t_3t_1t_5 \in \{1315\}$, $Nt_1t_5t_2t_5 = Nt_1t_4t_1t_5 \in \{1415\}$, and $Nt_1t_5t_2t_6 = Nt_1t_4t_7 \in \{147\}$. Since 1 and 3 are in the same orbit of $N^{(152)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $Nt_1t_5t_2t_3 = Nt_1t_3t_8 \in \{138\}$. Similarly $Nt_1t_5t_2t_10 = Nt_1t_3t_1t_5 \in \{1315\}$, $Nt_1t_5t_2t_9 = Nt_1t_4t_1t_5 \in \{1415\}$, and $Nt_1t_5t_2t_8 = Nt_1t_4t_7 \in \{147\}$.

Now we must consider the coset stabilizer of $N^{(152)}$. $N^{(152)} = \{e, (1, 3)(4, 10)(5, 9)(6, 8)\}$. The number of single cosets in [152] can be found by $\frac{|N|}{|N^{(152)}|} = \frac{20}{2} = 10$. The orbits of $N^{(152)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{2\}$, $\{7\}$, $\{1, 3\}$, $\{4, 10\}$, $\{5, 9\}$, and $\{6, 8\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $2 \in \{2\}$, $7 \in \{7\}$, $1 \in \{1, 3\}$, $4 \in \{4, 10\}$, $5 \in \{5, 9\}$, and $6 \in \{6, 8\}$. We note that $Nt_1t_5t_2t_7 = Nt_1t_5t_2^2 = Nt_4 \in \{15\}$. Through MAGMA we see that $Nt_1t_5t_2t_7 = Nt_1t_5t_2 \in \{152\}$, $Nt_1t_5t_2t_1 = Nt_1t_3t_8 \in \{138\}$, $Nt_1t_5t_2t_4 = Nt_1t_3t_1t_5 \in \{1315\}$, $Nt_1t_5t_2t_5 = Nt_1t_4t_1t_5 \in \{1415\}$, and $Nt_1t_5t_2t_6 = Nt_1t_4t_7 \in \{147\}$. Since 1 and 3 are in the same orbit of $N^{(152)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $Nt_1t_5t_2t_3 = Nt_1t_3t_8 \in \{138\}$. Similarly $Nt_1t_5t_2t_10 = Nt_1t_3t_1t_5 \in \{1315\}$, $Nt_1t_5t_2t_9 = Nt_1t_4t_1t_5 \in \{1415\}$, and $Nt_1t_5t_2t_8 = Nt_1t_4t_7 \in \{147\}$.

Now we must consider the coset stabilizer of $N^{(161)}$. $N^{(161)} = \{e, (1, 3)(4, 10)(5, 9)(6, 8), (1, 3, 5, 7, 9)(2, 4, 6, 8, 10), (1, 8, 5, 2, 9, 6, 3, 10, 7, 4), (1, 8)(2, 7)(3, 6)(4, 5)(9, 10), (1, 6)(2, 7)(3, 8)(4, 9)(5, 10), (1, 6)(2, 5)(3, 4)(7, 10)(8, 9), (1, 4, 7, 10,
3, 6, 9, 2, 5, 8, (1, 4)(2, 3)(5, 10)(6, 9)(7, 8), (1, 9, 7, 5, 3)(2, 10, 8, 6, 4), (1, 9)(2, 8)(3, 7)(4, 6), (1, 7, 3, 9, 5)(2, 8, 4, 10, 6), (1, 7)(2, 6)(3, 5)(8, 10), (1, 2, 3, 4, 5, 6, 7, 8, 9, 10), (1, 2)(3, 10)(4, 9)(5, 8)(6, 7), (1, 10, 9, 8, 7, 6, 5, 4, 3, 2), (1, 10)(2, 9)(3, 8)(4, 7)(5, 6), (1, 5, 9, 3, 7)(2, 6, 10, 4, 8)(1, 5)(2, 4)(6, 10)(7, 9), (2, 10)(3, 9)(4, 8)(5, 7). The number of single cosets in [161] can be found by \(\frac{|N|}{|N_{161}|} = \frac{20}{20} = 1\). The orbit of \(N_{161}\) is \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\). Now we select a representative the orbit and determine the double coset it belongs to. Let us select \(1 \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\). We notice that \(N_{1}t_{6}t_{1}t_{1} = N_{1}t_{6}t_{1}^{2} = N_{1}t_{6} \in [16]\). Now we must consider the coset stabilizer of \(N_{161}\). \(N_{161} = \{e, (1, 7)(2, 6)(3, 5)(8, 10)\}\). The number of single cosets in [152] can be found by \(\frac{|N|}{|N_{152}|} = \frac{20}{10} = 10\). The orbits of \(N_{161}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{4\}, \{9\}, \{1, 7\}, \{2, 6\}, \{3, 5\}, \{8, 10\}\). Now we select a representative \(t_{i}\) from each orbit and determine the double coset containing each \(t_{i}\). Let us select \(4 \in \{4\}, 9 \in \{9\}, 1 \in \{1, 7\}, 2 \in \{2, 6\}, 3 \in \{3, 5\}, \text{and} \ 8 \in \{8, 10\}\). We note that \(N_{1}t_{3}t_{1}t_{3}t_{3}t_{3}t_{3}t_{3}t_{3}t_{8} = N_{1}t_{3}t_{1}t_{3}t_{1}t_{3}t_{8} = N_{1}t_{3}t_{1}t_{3}t_{8}\) is a new double coset which we will denote \([13138]\). Through MAGMA we see that \(N_{1}t_{3}t_{1}t_{3}t_{4} = N_{1}t_{3}t_{3}t_{7} = N_{1}t_{3}t_{1}t_{3}t_{9} = N_{1}t_{3}t_{1}t_{3} \in [1413], N_{1}t_{3}t_{1}t_{3}t_{1} = N_{1}t_{3}t_{1}t_{8} = N_{1}t_{3}t_{1}t_{4} = [1318], \text{and} N_{1}t_{3}t_{1}t_{3}t_{2} = N_{1}t_{3}t_{1}t_{4} \in [1314]\). Since 1 and 7 are in the same orbit of \(N_{161}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{1}t_{3}t_{1}t_{3}t_{7} = N_{1}t_{3}t_{1}t_{8} \in [1318]\). Similarly \(N_{1}t_{3}t_{1}t_{3}t_{6} = N_{1}t_{3}t_{1}t_{4} \in [1314], N_{1}t_{3}t_{1}t_{3}t_{5} = N_{1}t_{3}t_{1} \in [131], \text{and} N_{1}t_{3}t_{1}t_{3}t_{10} = N_{1}t_{3}t_{1}t_{3}t_{8} \in [13138]\). Now we must consider the coset stabilizer of \(N_{161}\). \(N_{161} = \{e, \}\). The number of single cosets in [1314] can be found by \(\frac{|N|}{|N_{1314}|} = \frac{20}{1} = 20\). The orbits of \(N_{161}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \text{and} \{10\}\). Now we select a representative \(t_{i}\) from each orbit and determine the double coset containing each \(t_{i}\). Let us select \(1 \in \{1\}, 2 \in \{2\}, 3 \in \{3\}, 4 \in \{4\}, 5 \in \{5\}, 6 \in \{6\}, 7 \in \{7\}, 8 \in \{8\}, 9 \in \{9\}, \text{and} \ 10 \in \{10\}\). We note that \(N_{1}t_{3}t_{1}t_{4}t_{4} = N_{1}t_{3}t_{1}t_{4}^{2} = N_{1}t_{3}t_{1} \in [131]\). We see that \(N_{1}t_{3}t_{1}t_{3}t_{1} \text{and} \ N_{1}t_{3}t_{1}t_{4}t_{2} \text{belong to new double cosets. Let} [13141] \text{and} [13142] \text{denote them respectively. Through MAGMA we find that} N_{1}t_{3}t_{1}t_{4}t_{3} = N_{1}t_{3}t_{1}t_{5} = [1315], N_{1}t_{3}t_{1}t_{4}t_{5} = N_{1}t_{3}t_{1}t_{3} = [1313], N_{1}t_{3}t_{1}t_{4}t_{6} = N_{1}t_{3}t_{1}t_{8} = [1318], N_{1}t_{3}t_{1}t_{4}t_{7} = N_{1}t_{4}t_{1} = [141], t_{1}t_{3}t_{1}t_{4}t_{8} = N_{1}t_{4}t_{2} = [142], N_{1}t_{3}t_{1}t_{4}t_{9} = N_{1}t_{3}t_{8}t_{6} \in [1386] \text{and} N_{1}t_{3}t_{1}t_{4}t_{10} = N_{1}t_{3}t_{1}t_{3}t_{8} \in [13138].\) Now we must consider the coset stabilizer of \(N_{161}\). \(N_{161} = \{e, \}\). The
number of single cosets in $[1315]$ can be found by $\frac{|N|}{|\mathcal{H}(1315)|} = \frac{20}{10} = 20$. The orbits of $N^{(1315)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \text{and} \{10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}, 2 \in \{2\}, 3 \in \{3\}, 4 \in \{4\}, 5 \in \{5\}, 6 \in \{6\}, 7 \in \{7\}, 8 \in \{8\}, 9 \in \{9\}, \text{and} \{10\}$. We note that $N_{t_1}t_3t_1t_5t_5 = N_{t_1}t_3t_1t_5^2 = N_{t_1}t_3t_1 \in [131]$. Through MAGMA we find that $N_{t_1}t_3t_1t_5t_1 = N_{t_1}t_3t_2 \in [152], N_{t_1}t_3t_1t_5t_2 = N_{t_1}t_4t_1t_5 \in [1415], N_{t_1}t_3t_1t_5t_3 = N_{t_1}t_3t_1t_5t_8 \in [13138], N_{t_1}t_3t_1t_5t_4 = N_{t_1}t_3t_1t_6 \in [1316], N_{t_1}t_3t_1t_5t_6 = N_{t_1}t_3t_1t_4 \in [1314], N_{t_1}t_3t_1t_5t_7 = N_{t_1}t_3t_1t_4t_2 \in [13142], t_1t_3t_1t_5t_8 = N_{t_1}t_3t_7t_4 \in [1374], N_{t_1}t_3t_1t_5t_9 = N_{t_1}t_3t_7 \in [137] \text{and} N_{t_1}t_3t_1t_5t_{10} = N_{t_1}t_3t_8 \in [138].$

Now we must consider the coset stabilizer of $N^{(1316)}$. $N^{(1316)} = \{e, \}$ The number of single cosets in $[1316]$ can be found by $\frac{|N|}{|\mathcal{H}(1316)|} = \frac{20}{10} = 20$. The orbits of $N^{(1316)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \text{and} \{10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}, 2 \in \{2\}, 3 \in \{3\}, 4 \in \{4\}, 5 \in \{5\}, 6 \in \{6\}, 7 \in \{7\}, 8 \in \{8\}, 9 \in \{9\}, \text{and} \{10\}$. We note that $N_{t_1}t_3t_1t_6t_6 = N_{t_1}t_3t_1t_6^2 = N_{t_1}t_3t_1 \in [131]$. Through MAGMA we find that $N_{t_1}t_3t_1t_6t_1 = N_{t_1}t_4t_9 \in [149], N_{t_1}t_3t_1t_6t_2 = N_{t_1}t_4t_{10} \in [1410], N_{t_1}t_3t_1t_6t_3 = N_{t_1}t_4t_{10}t_3 \in [14103], N_{t_1}t_3t_1t_6t_4 = N_{t_1}t_4t_1t_5 \in [1415], N_{t_1}t_3t_1t_6t_5 = N_{t_1}t_4t_1 \in [141], N_{t_1}t_3t_1t_6t_7 = N_{t_1}t_3t_1t_5 \in [1315], t_4t_1t_3t_1t_6t_8 = N_{t_1}t_3t_1t_3 \in [13138], N_{t_1}t_3t_1t_6t_9 = N_{t_1}t_3t_8t_6 \in [1386] \text{and} N_{t_1}t_3t_6t_{10} = N_{t_1}t_3t_8 \in [138].$

Now we must consider the coset stabilizer of $N^{(1318)}$. $N^{(1318)} = \{e, \}$ The number of single cosets in $[1318]$ can be found by $\frac{|N|}{|\mathcal{H}(1318)|} = \frac{20}{10} = 20$. The orbits of $N^{(1318)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \text{and} \{10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}, 2 \in \{2\}, 3 \in \{3\}, 4 \in \{4\}, 5 \in \{5\}, 6 \in \{6\}, 7 \in \{7\}, 8 \in \{8\}, 9 \in \{9\}, \text{and} \{10\}$. We note that $N_{t_1}t_3t_1t_8t_8 = N_{t_1}t_3t_1t_8^2 = N_{t_1}t_3t_1 \in [131]$ and $N_{t_1}t_3t_1t_8t_5$ is a new double coset denoted $[13185]$. Through MAGMA we find that $N_{t_1}t_3t_1t_8t_1 = N_{t_1}t_3t_1t_3 \in [1313], N_{t_1}t_3t_1t_8t_2 = N_{t_1}t_3t_1t_3 \in [13138], N_{t_1}t_3t_1t_8t_3 = N_{t_1}t_4t_{10}t_3 \in [14103], N_{t_1}t_3t_1t_8t_4 = N_{t_1}t_3t_7t_4 \in [1374], N_{t_1}t_3t_1t_8t_6 = N_{t_1}t_4t_1t_5 \in [1415], t_1t_3t_1t_8t_7 = N_{t_1}t_4t_7 \in [147], N_{t_1}t_3t_1t_8t_9 = N_{t_1}t_4t_1 \in [141] \text{and} N_{t_1}t_3t_1t_8t_{10} = N_{t_1}t_3t_1t_4 \in [1314].$
Now we must consider the coset stabilizer of \(N^{(1374)}\). \(N^{(1374)} = \{e, (1, 7)(2, 6)(3, 5)(8, 10)\}\). The number of single cosets in \([1374]\) can be found by \(\frac{|N|}{|\text{Stab}(N)|} = \frac{20}{2} = 10\). The orbits of \(N^{(1374)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{4\}, \{9\}, \{1, 7\}, \{2, 6\}, \{3, 5\}, and \{8, 10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(4 \in \{4\}\), \(9 \in \{9\}\), \(7 \in \{1, 7\}\), \(2 \in \{2, 6\}\), \(3 \in \{3, 5\}\), and \(8 \in \{8, 10\}\). We note that \(N_{11}t_3t_7t_4t_4 = N_{11}t_3t_7t_4^2 = N_{11}t_3 t_1 \in [13]\). Through MAGMA we find that \(N_{11}t_3t_7t_4t_9 = N_{11}t_4t_{10}t_3 \in [14103], N_{11}t_3t_7t_4t_1 = N_{11}t_3t_1t_8t_5 \in [13185], N_{11}t_3t_7t_4t_2 = N_{11}t_3t_1t_4t_2 \in [13142], N_{11}t_3t_7t_4t_3 = N_{11}t_3t_1t_5 \in [1315], N_{11}t_3t_7t_4t_8 = N_{11}t_3t_1t_8 \in [1318].\) Since 1 and 7 are in the same orbit of \(N^{(1374)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N_{11}t_3t_7t_4t_7 = N_{11}t_3t_1t_8t_5 \in [13185].\) Similarly, \(N_{11}t_3t_7t_4t_6 = N_{11}t_3t_1t_4t_2 \in [13142], N_{11}t_3t_7t_4t_4 = N_{11}t_3t_1t_5 \in [1315], and N_{11}t_3t_7t_4t_10 = N_{11}t_3t_1t_8 \in [1318].\)

Now we must consider the coset stabilizer of \(N^{(1386)}\). \(N^{(1386)} = \{e, (1, 10)(2, 9)(3, 8)(4, 7)(5, 6)\}\). The number of single cosets in \([1386]\) can be found by \(\frac{|N|}{|\text{Stab}(N)|} = \frac{20}{2} = 10\). The orbits of \(N^{(1386)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{1, 10\}, \{2, 9\}, \{3, 8\}, \{4, 7\}, and \{5, 6\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1, 10\}\), \(2 \in \{2, 9\}\), \(3 \in \{3, 8\}\), \(4 \in \{4, 7\}\), and \(6 \in \{5, 6\}\). We note that \(N_{12}t_3t_8t_6t_6 = N_{12}t_3t_8t_6^2 = N_{12}t_3t_8 \in [138].\) Through MAGMA we see that \(N_{12}t_3t_8t_6t_1 = N_{12}t_3t_4t_2 \in [142], N_{12}t_3t_8t_6t_2 = N_{12}t_3t_1t_4 \in [1314], N_{12}t_3t_8t_6t_3 = N_{12}t_3t_1t_3t_8 \in [13138], and N_{12}t_3t_8t_6t_4 = N_{12}t_3t_1t_6 \in [1316].\) Since 1 and 10 are in the same orbit of \(N^{(1386)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}, \(N_{12}t_3t_8t_6t_{10} = N_{12}t_4t_2 \in [142].\) Similarly \(N_{12}t_3t_8t_6t_9 = N_{12}t_3t_1t_4 \in [1314], N_{12}t_3t_8t_6t_8 = N_{12}t_3t_1t_3t_8 \in [13138], N_{12}t_3t_8t_6t_7 = N_{12}t_3t_1t_6 \in [1316] and N_{12}t_3t_8t_6t_5 = N_{12}t_3t_8 \in [138].\)

Now we must consider the coset stabilizer of \(N^{(1413)}\). \(N^{(1413)} = \{e, (1, 7)(2, 6)(3, 5)(8, 10)\}\). The number of single cosets in \([1413]\) can be found by \(\frac{|N|}{|\text{Stab}(N)|} = \frac{20}{2} = 10\). The orbits of \(N^{(1413)}\) on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\} are \{4\}, \{9\}, \{1, 7\}, \{2, 6\}, \{3, 5\}, and \{8, 10\}. Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(4 \in \{4\}\), \(9 \in \{9\}\), \(7 \in \{1, 7\}\), \(2 \in \{2, 6\}\), \(3 \in \{3, 5\}\), and \(8 \in \{8, 10\}\). We note that \(N_{14}t_4t_1t_3t_3 = N_{14}t_4t_1t_3^2 = N_{14}t_4t_1 \in [141].\) Through MAGMA we find that \(N_{14}t_4t_1t_3t_4 = N_{14}t_4t_1t_10 \in [1410], N_{14}t_4t_1t_3t_9 = N_{14}t_3t_1t_3 \in [1313], N_{14}t_4t_1t_3t_5 = N_{14}t_3t_4t_1 \in [13141], N_{14}t_4t_1t_3t_2 = N_{14}t_4t_1t_4 \in [1414], N_{14}t_4t_1t_3t_8 = N_{14}t_3t_1t_3t_8 \in [13138].\) Since 1 and 7 are in the same orbit of
\(N^{(1413)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\). \(N_{t_1t_4t_1t_3t_7} = N_{t_1t_3t_1t_4t_1} \in [13141]\). Similarly, \(N_{t_1t_4t_1t_3t_6} = N_{t_1t_4t_1t_4} \in [1414]\), \(N_{t_1t_4t_1t_3t_5} = N_{t_1t_4t_1} \in [141]\), and \(N_{t_1t_4t_1t_3t_{10}} = N_{t_1t_3t_1t_3t_8} \in [13138]\).

Now we must consider the coset stabilizer of \(N^{(1414)}\). \(N^{(1414)} = \{e, (2, 10)(3, 9)(4, 8)(5, 7)\}\). The number of single cosets in \([1414]\) can be found by \(\frac{|\mathcal{N}|}{|N^{(1414)}|} = \frac{20}{2} = 10\).

The orbits of \(N^{(1414)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}\), \(\{6\}\), \(\{2, 10\}\), \(\{3, 9\}\), \(\{4, 8\}\) and \(\{5, 7\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(6 \in \{6\}\), \(2 \in \{2, 10\}\), \(3 \in \{3, 9\}\), \(4 \in \{4, 8\}\), and \(5 \in \{5, 7\}\). We note that \(N_{t_1t_4t_1t_4t_3} = N_{t_1t_4t_1t_4t_1} = N_{t_1t_4t_1} \in [141]\) and \(N_{t_1t_4t_1t_4t_1}\) is a new double coset denoted \([14141]\). Through MAGMA we see that \(N_{t_1t_4t_1t_4t_6} = N_{t_1t_3t_1t_4t_1} \in [13141]\), \(N_{t_1t_4t_1t_4t_2} = N_{t_1t_3t_1t_4t_5} \in [13185]\), \(N_{t_1t_4t_1t_4t_3} = N_{t_1t_4t_1t_5} \in [1415]\) and \(N_{t_1t_4t_1t_4t_5} = N_{t_1t_3t_1t_3} \in [1413]\). Since 2 and 10 are in the same orbit of \(N^{(1414)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\), \(N_{t_1t_4t_1t_4t_{10}} = N_{t_1t_3t_1t_8} \in [13185]\). Similarly \(N_{t_1t_4t_1t_4t_9} = N_{t_1t_4t_1t_5} \in [1415]\), \(N_{t_1t_4t_1t_8} = N_{t_1t_4t_1} \in [141]\), and \(N_{t_1t_4t_1t_7} = N_{t_1t_4t_1t_3} \in [1413]\).

Now we must consider the coset stabilizer of \(N^{(1415)}\). \(N^{(1415)} = \{e, \}\). The number of single cosets in \([1415]\) can be found by \(\frac{|\mathcal{N}|}{|N^{(1415)}|} = \frac{20}{1} = 20\).

The orbits of \(N^{(1415)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{1\}\), \(\{2\}\), \(\{3\}\), \(\{4\}\), \(\{5\}\), \(\{6\}\), \(\{7\}\), \(\{8\}\), \(\{9\}\), and \(\{10\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(1 \in \{1\}\), \(2 \in \{2\}\), \(3 \in \{3\}\), \(4 \in \{4\}\), \(5 \in \{5\}\), \(6 \in \{6\}\), \(7 \in \{7\}\), \(8 \in \{8\}\), \(9 \in \{9\}\), and \(10 \in \{10\}\). We note that \(N_{t_1t_4t_1t_5t_5} = N_{t_1t_4t_1t_5t_3} = N_{t_1t_4t_1} \in [141]\). Through MAGMA we find that \(N_{t_1t_4t_1t_5t_1} = N_{t_1t_3t_1t_5} \in [1315]\), \(N_{t_1t_4t_1t_5t_2} = N_{t_1t_3t_1t_3t_8} \in [13138]\), \(N_{t_1t_4t_1t_5t_3} = N_{t_1t_4t_1t_5} \in [14103]\), \(N_{t_1t_4t_1t_5t_4} = N_{t_1t_3t_1t_6} \in [1316]\), \(N_{t_1t_4t_1t_5t_6} = N_{t_1t_4t_1t_4} \in [1414]\), \(N_{t_1t_4t_1t_5t_7} = N_{t_1t_3t_1t_5} \in [13185]\), \(t_1t_4t_1t_5t_8 = N_{t_1t_3t_1t_8} \in [1318]\), \(N_{t_1t_4t_1t_5t_9} = N_{t_1t_4t_7} \in [147]\) and \(N_{t_1t_4t_1t_5t_{10}} = N_{t_1t_5t_2} \in [152]\).

Now we must consider the coset stabilizer of \(N^{(14103)}\). \(N^{(14103)} = \{e, (1, 5)(2, 4)(6, 10)(7, 9)\}\). The number of single cosets in \([14103]\) can be found by \(\frac{|\mathcal{N}|}{|N^{(14103)}|} = \frac{20}{2} = 10\).

The orbits of \(N^{(14103)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}\) are \(\{3\}\), \(\{8\}\), \(\{1, 5\}\), \(\{2, 4\}\), \(\{6, 10\}\), and \(\{7, 9\}\). Now we select a representative \(t_i\) from each orbit and determine the double coset containing each \(t_i\). Let us select \(3 \in \{3\}\), \(8 \in \{8\}\), \(1 \in \{1, 5\}\), \(2 \in \{2, 4\}\), \(10 \in \{6, 10\}\), and \(7 \in \{7, 9\}\). We note that \(N_{t_1t_4t_1t_10t_3t_3} = N_{t_1t_4t_1t_10t_3} = N_{t_1t_4t_1t_10} \in [1410]\). Through
MAGMA we see that $N t_1 t_3 t_4 t_5 t_8 = N t_1 t_3 t_7 t_4 \in [1374]$, $N t_1 t_4 t_10 t_1 = N t_1 t_4 t_10 t_5 \in [1415]$, $N t_1 t_4 t_10 t_3 t_2 = N t_1 t_3 t_1 t_6 \in [1316]$, $N t_1 t_4 t_10 t_3 t_6 = N t_1 t_3 t_1 t_3 \in [1313]$ and $N t_1 t_4 t_10 t_3 t_7 = N t_1 t_3 t_1 t_8 \in [1318]$. Since 1 and 5 are in the same orbit of $N^{(14103)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $N t_1 t_4 t_10 t_5 = N t_1 t_4 t_1 t_5 \in [1415]$. Similarly $N t_1 t_4 t_10 t_3 t_4 = N t_1 t_3 t_1 t_6 \in [1316]$, $N t_1 t_4 t_10 t_3 t_10 = N t_1 t_3 t_1 t_3 \in [1313]$, and $N t_1 t_4 t_10 t_3 t_9 = N t_1 t_3 t_1 t_8 \in [1318]$.

Now we must consider the coset stabilizer of $N^{(13138)}$. $N^{(13138)} = \{e, \}$. The number of single cosets in $[13138]$ can be found by $\frac{|N|}{|N^{(13138)}|} = \frac{20}{1} = 20$. The orbits of $N^{(13138)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{1\}$, $\{2\}$, $\{3\}$, $\{4\}$, $\{5\}$, $\{6\}$, $\{7\}$, $\{8\}$, $\{9\}$, and $\{10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $1 \in \{1\}$, $2 \in \{2\}$, $3 \in \{3\}$, $4 \in \{4\}$, $5 \in \{5\}$, $6 \in \{6\}$, $7 \in \{7\}$, $8 \in \{8\}$, $9 \in \{9\}$, and $10 \in \{10\}$. We note that $N t_1 t_3 t_1 t_3 t_8 t_8 = N t_1 t_3 t_1 t_3 t_6 \in [1313]$. Through MAGMA we find that $N t_1 t_3 t_1 t_3 t_8 t_1 = N t_1 t_4 t_1 t_5 \in [1415]$, $N t_1 t_3 t_1 t_3 t_8 t_2 = N t_1 t_3 t_1 t_5 \in [1315]$, $N t_1 t_3 t_1 t_3 t_8 t_3 = N t_1 t_3 t_1 t_6 \in [1316]$, $N t_1 t_3 t_1 t_3 t_8 t_4 = N t_1 t_3 t_1 t_3 t_6 \in [1386]$, $t_1 t_3 t_1 t_3 t_8 t_5 = N t_1 t_3 t_1 t_4 \in [1314]$, $N t_1 t_3 t_1 t_3 t_8 t_6 = N t_1 t_3 t_1 t_1 \in [13141]$, $N t_1 t_3 t_1 t_3 t_8 t_7 = N t_1 t_4 t_1 t_3 \in [1413]$, $N t_1 t_3 t_1 t_3 t_8 t_9 = N t_4 t_3 t_1 t_8 \in [1318]$ and $N t_1 t_3 t_1 t_3 t_8 t_{10} = N t_4 t_1 t_1 t_3 \in [14103]$.

Now we must consider the coset stabilizer of $N^{(13141)}$. $N^{(13141)} = \{e, (1, 7)(2, 6) (3, 5)(8, 10)\}$. The number of single cosets in $[13141]$ can be found by $\frac{|N|}{|N^{(13141)}|} = \frac{20}{2} = 10$. The orbits of $N^{(13141)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{4\}$, $\{9\}$, $\{1, 7\}$, $\{2, 6\}$, $\{3, 5\}$, and $\{8, 10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $4 \in \{4\}$, $9 \in \{9\}$, $7 \in \{1, 7\}$, $2 \in \{2, 6\}$, $3 \in \{3, 5\}$, and $8 \in \{8, 10\}$. We note that $N t_1 t_3 t_1 t_4 t_1 t_1 = N t_1 t_3 t_1 t_4 t_1^2 = N t_1 t_3 t_1 t_4 \in [1314]$, and $N t_1 t_3 t_1 t_4 t_1 t_9$ is a new double coset denoted $[131419]$. Through MAGMA we find that $N t_1 t_3 t_1 t_4 t_4 t_1 t_4 = N t_1 t_4 t_1 t_4 \in [1414]$, $N t_1 t_3 t_1 t_4 t_1 t_2 = N t_1 t_3 t_1 t_3 t_8 \in [13138]$, $N t_1 t_3 t_1 t_3 t_8 t_3 = N t_1 t_4 t_1 t_3 \in [1413]$, $N t_1 t_4 t_1 t_3 t_2 = N t_1 t_4 t_1 t_4 \in [1414]$, and $N t_1 t_4 t_1 t_3 t_8 = N t_1 t_3 t_1 t_3 t_8 \in [13138]$. Since 1 and 7 are in the same orbit of $N^{(1413)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $N t_1 t_4 t_1 t_3 t_7 = N t_1 t_3 t_1 t_4 t_1 \in [13141]$. Similarly, $N t_1 t_4 t_1 t_3 t_6 = N t_1 t_4 t_1 t_4 \in [1414]$, $N t_1 t_4 t_1 t_3 t_5 = N t_1 t_4 t_1 \in [141]$, and $N t_1 t_4 t_1 t_3 t_{10} = N t_1 t_3 t_1 t_8 \in [13138]$.

Now we must consider the coset stabilizer of $N^{(13142)}$. $N^{(13142)} = \{e, (1, 7)(2, 6) (3, 5)(8, 10)\}$. The number of single cosets in $[13142]$ can be found by $\frac{|N|}{|N^{(13142)}|} = \frac{20}{2} = 10$. 

The orbits of $N^{(13142)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ are $\{4\}$, $\{9\}$, $\{1, 7\}$, $\{2, 6\}$, $\{3, 5\}$, and $\{8, 10\}$. Now we select a representative $t_i$ from each orbit and determine the double coset containing each $t_i$. Let us select $4 \in \{4\}$, $9 \in \{9\}$, $7 \in \{1, 7\}$, $2 \in \{2, 6\}$, $3 \in \{3, 5\}$, and $8 \in \{8, 10\}$. We note that $N_{t_1}t_3t_1t_4t_2 = N_{t_1}t_3t_1t_4t_2^2 = N_{t_1}t_3t_1t_4 \in [1314]$. Through MAGMA we find that $N_{t_1}t_3t_1t_4t_2t_4 = N_{t_1}t_3t_1t_4t_1t_9 \in [131419]$, $N_{t_1}t_3t_1t_4t_2t_9 = N_{t_1}t_3t_1t_8t_5 \in [13185]$, $N_{t_1}t_3t_1t_4t_2t_1 = N_{t_1}t_3t_1t_5 \in [1315]$, $N_{t_1}t_3t_1t_4t_2t_3 = N_{t_1}t_3t_1t_4t_1 \in [13141]$, and $N_{t_1}t_3t_1t_4t_2t_8 = N_{t_1}t_3t_7t_4 \in [1374]$. Since 1 and 7 are in the same orbit of $N^{(13142)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$, $N_{t_1}t_3t_1t_4t_2t_7 = N_{t_1}t_3t_1t_5 \in [1315]$. Similarly, $N_{t_1}t_3t_1t_4t_2t_6 = N_{t_1}t_4t_4 \in [1414]$, $N_{t_1}t_3t_1t_4t_2t_5 = N_{t_1}t_3t_1t_4t_1 \in [13141]$, and $N_{t_1}t_3t_1t_4t_2t_{10} = N_{t_1}t_3t_7t_4 \in [1374]$. Now we must consider the coset stabilizer of $N^{(14141)}$. $N^{(14141)} = \{e, (1, 5)(2, 4)(6, 10)(7, 9), (1, 9, 7, 5, 3)(2, 10, 8, 6, 4), (1, 3)(4, 10)(5, 9)(6, 8), (1, 7)(2, 6)(3, 5)(8, 10), (1, 7, 3, 9, 5)(2, 8, 4, 10, 6), (1, 3, 5, 7, 9)(2, 4, 6, 8, 10), (2, 10)(3, 9)(4, 8)(5, 7), (1, 9)(2, 8)(3, 7)(4, 6), (1, 5, 9, 3, 7)(2, 6, 10, 4, 8)\}$. The number of single cosets in [14141] can be found by $\frac{|N|}{|N^{(14141)}|} = \frac{20}{10} = 2$. The orbit of $N^{(14141)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ is $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$. Now we select a representative, say $t_1$ from the orbit and determine the double coset that contains it. We see that $N_{t_1}t_4t_4t_1t_4 = N_{t_1}t_4t_1t_4 \in [1414]$. Now we must consider the coset stabilizer of $N^{(131419)}$. $N^{(131419)} = \{e, (2, 10)(3, 9)(4, 8)(5, 7), (1, 3, 5, 7, 9)(2, 4, 6, 8, 10), (1, 9)(2, 8)(3, 7)(4, 6), (1, 3)(4, 10)(5, 9)(6, 8), (1, 5, 9, 3, 7)(2, 6, 10, 4, 8), (1, 9, 7, 5, 3)(2, 10, 8, 6, 4), (1, 7)(2, 6)(3, 5)(8, 10), (1, 5)(2, 4)(6, 10)(7, 9), (1, 7, 3, 9, 5)(2, 8, 4, 10, 6)\}$. The number of single cosets in [131419] can be found by $\frac{|N|}{|N^{(131419)}|} = \frac{20}{10} = 2$. The orbit of $N^{(14141)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ is $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$. Now we select a representative, say $t_9$ from the orbit and determine the double coset that contains it. We see that $N_{t_1}t_3t_1t_4t_9t_9 = N_{t_1}t_3t_1t_4t_1t_9t_9 = N_{t_1}t_3t_1t_4t_1 \in [13141]$. We have no new double cosets and we see that we have the following Cayley Diagram.
Figure 2.5: Cayley Diagram of $2 \times [3 \times L_2(3) : 2]$ over $D_{10}$
Chapter 3

Composition Factors

3.1 Preliminaries

In this chapter we will look at the isomorphic types of our finite groups. Every composition series gives us a product of simple groups that make up a group $G$. We want to write $G$ as a product of finite simple subgroups that provide us with the isomorphic type of our progenitors when factored by specified relations.

**Theorem 3.1.** $G$ is an extension of $K$ by $Q$ if $G$ has a normal subgroup $K_1 \cong K$ such that $G/K_1 \cong Q$, where $G = KQ$.

**Definition 3.2** (Center). The center of a group $G$, denoted by $Z(G)$, is the set of all $a \in G$ that commute with every element of $G$.

**Definition 3.3** (Normal Series). A chain of subgroups of $G$, $G_0 = G \supseteq G_1 \supseteq G_2 \supseteq \ldots \supseteq G_n = 1$ such that $G_i \trianglelefteq G$, $\forall i, 1 \leq i \leq n$ is called a normal series of $G$.

**Definition 3.4** (Subnormal Series). A chain of subgroups of $G$, $G_0 = G \supseteq G_1 \supseteq G_2 \supseteq \ldots \supseteq G_n = 1$ such that $G_{i+1} \trianglelefteq G_i$, $\forall i, 0 \leq i \leq n - 1$ is called a subnormal series of $G$.

**Note 3.5.** Any two composition series of a group are isomorphic.

**Note 3.6.** The composition factors $G_0/g_1, G_1/g_2, \ldots, G_{n-1}/g_n$ of the composition series $G_0 = G \supseteq G_1 \supseteq G_2 \supseteq \ldots \supseteq G_{n-1} \supseteq G_n$ are simple.
**List of Possible Extensions**

1. Direct Product: $G$ is a direct product of $H$ by $K$ if $H$ and $K$ are both normal in $G$ and $G = H \times K$, where $H \cap K = 1$.

2. Semi-Direct Product: $G$ is a semi-direct product of $H$ by $K$ if $H$ is normal in $G$ and $H \cap K = 1$. The semi-direct product is denoted $H : K$.

3. Central Extension: $G$ is a central extension of $H$ by $K$, denoted $H \cdot K$ if the following are true.
   
   (a) $G$ is perfect
   
   (b) $H$ is normal in $G$
   
   (c) $H$ is the center of $G$

4. Mixed Extension: A mixed extension, denoted $G = H \cdot N$, is when you have an abelian group which is not the center of $G$.

### 3.2 Extension Problem $U_3(3) : 2$

Consider the group

$$G = \langle a, b, t | a^2, b^3, (a \ast b)^7, (b \ast a \ast b^{-1} \ast a)^4, t^2, (t, b), (t, a \ast b \ast a \ast b^{-1} \ast a), (a \ast b^{-1} \ast a \ast t)^n, (a \ast b^{-1} \ast a \ast t^a)^p, (a \ast b^{-1} \ast a \ast b \ast t)^q, (a \ast b^{-1} \ast a \ast b \ast t^{a^2})^r >$$

Using MAGMA we have the following composition factors

```
CompositionFactors(G1);
G
    | Cyclic(2)
    * 2A(2, 3) = U(3, 3)
    | 1
```

So we have the composition series $G_1 \supseteq G_2 \supseteq 1$ where $G = (G_1/G_2) \cdot (G_2/1)$

$G = C_2 \cdot U_3(3)$.

The group also has the following normal lattice.
NL:=NormalLattice(G1);
NL;

Normal subgroup lattice
-----------------------

---
[2] Order 6048 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:

First we check the normal lattice for a central extension and normally we also check to see if there is a direct product between the normal subgroups but we can see from the normal lattice that a direct product is not possible.

> Center(G1);
Permutation group acting on a set of cardinality 72
Order = 1

Now we check as to whether or not there is a semidirect product between Cyclic(2) and $U_3(3)$. We check if this is possible by running a loop to find all subgroups of G1 that are of order 2.

> S:=Subgroups(G1);
> for i in [1..#S] do if #S[i]‘subgroup eq 2 then i;
for | if>end if; end for;
2
3

So we see that there does exist a subgroup of order 2. Now we look for an element of order 2 in G1 and outside NL[2].

for | if>then R:=r; break; end if; end for;

>R:=G1!(1, 6) (2, 15) (3, 32) (4, 8) (5, 61) (7, 28) (9, 42) (10, 44)
(11, 50) (12, 17) (13, 46) (14, 30) (16, 69) (18, 36) (19, 38) (21, 45)
(22, 35) (23, 26) (24, 41) (25, 63) (27, 64) (29, 67) (30, 54)
(31, 52) (33, 60) (34, 70) (37, 57) (39, 47) (40, 48) (43, 68) (49, 65)
(51, 55) (53, 71) (56, 59) (58, 66) (62, 72);
Similarly since we check as to whether or not $\text{NL}[2]$ is $U_3(3)$, we need to find the two generators of $\text{NL}[2]$.

```plaintext
> for g, h in NL[2] do if Order(g) eq 2 and Order(h) eq 6 and
   for | if > NL[2] eq sub<NL[2]|g, h>
   for | if > then a := g; b := h; break; end if; end for;

A := G1!(1, 21)(3, 25)(4, 27)(6, 44)(9, 55)(11, 60)(13, 22)(14,
(15, 63)(17, 64)(18, 30)(19, 43)(20, 70)(23, 68)(28, 36)
(48, 66)(50, 52);

B := G1!(1, 23, 62, 5, 59, 40)(2, 49, 66)(3, 50, 39)(4, 33, 43,
(25, 53, 14)(6, 61, 56, 26, 72, 48)(7, 51, 64, 21, 29, 41)
(8, 68, 71)(9, 37, 16, 19, 54, 12)(10, 70, 22)(11, 57, 47,
(17, 32, 38)(13, 31, 18)(15, 63, 65, 60, 58, 20)(24, 35, 45,
(44, 55, 34)(27, 67, 28)(30, 42, 69)(36, 52, 46);

Letting $i$ and $j$ represent $A$ and $B$ respectively, we run the Schreier System in
order to find the action of $R$ on the generators of $\text{NL}[2]$, $A$ and $B$.

```plaintext
> AA := [Id(NN) : i in [1..2]];
> for i in [1..6048] do if A^R eq ArrayP[i] then AA[1] := Sch[i];
   Sch[i]; end if; end for;

```plaintext
> for i in [1..6048] do if B^R eq ArrayP[i] then AA[1] := Sch[i];
   Sch[i]; end if; end for;

```plaintext
> f1, h, k1 := CosetAction(H, sub<H|Id(H)>);
> s := IsIsomorphic(NL[3], h);
> s;
true
```
As we can see above, the presentation we derived from the composition factors proved to be isomorphic to $G$ giving us the isomorphic type $U_3(3) : 2$.

### 3.3 Extension Problem

Consider the group

$$G = \langle a, b, x, t | a^4, b^4, (a, b), x^2, a^x = b, b^x = a, t^2, (t, b), (x * t)^0, (x * a * t * t^x)^3, (a * t * t^a)^0, (a * x * t(x^2) * t^x * t)^0, (a * x * t(x^2) * t^a * t)^{10} \rangle$$

Using MAGMA we have the following composition factors

```
CompositionFactors(G1);
G
| Cyclic(2)
*| Alternating(6)
*| Cyclic(3)
*| Cyclic(2)
1
```

So we have the composition series $G_1 \supset G_2 \supset G_3 \supset G_4 \supset 1$ where $G = (G_1/G_2) \cdot (G_2/G_3) \cdot (G_3/G_4) \cdot (G_4/1)$

$$G = C_2 \cdot A_6 \cdot C_3 \cdot C_2.$$ 

The group also has the following normal lattice.

```
NL:=NormalLattice(G1);
NL;
```

Normal subgroup lattice
------------------------

```
[9] Order 4320  Length 1  Maximal Subgroups: 6 7 8
---
[8] Order 2160  Length 1  Maximal Subgroups: 5
---
```
After investigating the normal lattice we devised two methods to solve the extension problem.

### 3.3.1 Method 1: \(2 \times [A_6 \cdot 3 : 2]\)

First we check the normal lattice for a central extension and we also check to see if there is a direct product between the normal subgroups.

```plaintext
> Center(G1);
Permutation group acting on a set of cardinality 540
Order = 2
> for i in [6..8] do if IsIsomorphic(DirectProduct(NL[2],NL[i]),G1) then i; end if; end for;
7
8
```

Now we were given 7 and 8 are direct products. We chose to investigate NL[8]. Since NL[2] is a normal subgroup of order 2, there is a direct product between NL[2] and NL[8]. Now we look at the composition factors and the normal lattice of 8.

```plaintext
> CompositionFactors(NL[8]);
G
  | Cyclic(2)
  * Alternating(6)
  * Cyclic(3)
1
> nl:=NormalLattice(NL[8]);
> nl;
Normal subgroup lattice
-----------------------
```
There is a cyclic(3) in the composition factors of NL[8] and a group in the normal lattice of NL[8] that is of order 3. Alternating(6) is of order 360 and is not a normal subgroup of NL[8], therefore it is not a direct product with cyclic(3). Now we look to see if [3] is a semidirect product of cyclic(3) by Alternating(6), however NL[8] does not have a subgroup of order 360.

Since NL[3] is not a direct product not a semi-direct product of Alternating(6) by cyclic(3) we check the derived groups of NL[8]. The derived group of NL[8] is of order 1080 which is nl[3] of NL[8]. We check that nl[3] is perfect, which we find is true. Now we know that cyclic(3) and alternating(6) is a perfect group of order 1080 and we can get the presentation.

> D:=DerivedGroup(NL[8]);
> D;
Permutation group D acting on a set of cardinality 540
Order = 1080 = 2^3 * 3^3 * 5
> CompositionFactors(D);
G
| Alternating(6)
* |
| Cyclic(3)
1

Now we use the perfect group database to find the presentation of the perfect group.

> DB:= PerfectGroupDatabase();
> DB;
Database of Perfect Groups
> for i in [1..2] do Group(DB,1080,i); end for;
Finitely presented group on 3 generators
Relations
  a^6 = Id($)
  b^3 = Id($)
c^3 = \text{Id}(\$)
(b \ast c)^4 = \text{Id}(\$)
(b \ast c^{-1})^5 = \text{Id}(\$)
a^{-1} \ast b^{-1} \ast c \ast b \ast c \ast b^{-1} \ast c \ast b \ast c^{-1} = \text{Id}(\$
[<[18, [Finitely presented group on 2 generators (free)
]>]

> s:=IsIsomorphic(PermutationGroup(DB,1080,1),nl[3]);
> s;
true
> H<a,b,c>:=Group<a,b,c|a^6,b^3,c^3,(b*c)^4,(b*c^{-1})^5,
a^{-1}*b^{-1} * c * b * c * b^{-1} * c * b * c^{-1}>
> f1,H1,k1:=CosetAction(H,sub<H|Id(H)>);
> #H1;
1080
> s,t :=IsIsomorphic(H1,nl[3]);
> s;
true

Cyclic(2) is left in NL[8]. Since there is no normal group of order 2 in NL[8] there is not a direct product. There is a subgroup of order 2 in NL[8] so it is a semidirect product with Alternating(6) and Cyclic(3). Now that we have the presentation of Cyclic(3) and Alternating(6) we need to find the action of Cyclic(2) on the presentation by using the schreier system. And finally, we can add the action of Cyclic(2) into the presentation.

\[ HHG<a,b,c,u,d>:=Group<a,b,c,u,d|a^6,b^3,c^3,(b*c)^4,(b*c^{-1})^5,
a^{-1}*b^{-1} + c*b + c*b^{-1} * c*b + c^{-1} >, u^2, a^u=b*a^{-1}b^{-1},
b^u=a*c^{-1}a, c^u=c^{-1}b^{-1}c, d^2,(d,a),(d,b),(d,c),(d,u)>; \]

Lastly we check that our presentation is isomorphic to our extension problem which we find to be true. So the isomorphic image we discover from Method 1 is \(2 \times [(A_6 \cdot 3) : 2]\).

3.3.2 **Method 2: 6 \cdot PGL_2(9)**

As before, the extension problem has the following normal lattice.

\[ NL:=NormalLattice(G1); \]
NL;

Normal subgroup lattice
-----------------------

<table>
<thead>
<tr>
<th>Order</th>
<th>Length</th>
<th>Maximal Subgroups</th>
</tr>
</thead>
<tbody>
<tr>
<td>4320</td>
<td>1</td>
<td>6 7 8</td>
</tr>
<tr>
<td>2160</td>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>2160</td>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>2160</td>
<td>1</td>
<td>4 5</td>
</tr>
<tr>
<td>1080</td>
<td>1</td>

</tr>
<tr>
<td>2</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

When we investigate NL[4] we see that NL[4] is a cyclic group of order 6 generated by D. We check as to whether or not we will have PGL(2,9) when we factor G by NL[4], which we will call q. We check if q is isomorphic to PGL(2,9) and find that they are isomorphic to each other.

```��|> NL[4];
Permutation group acting on a set of cardinality 540
Order = 6 = 2 * 3
> Order(NL[4].1);
6
> D:=NL[4].1;
true
> IsCyclic(NL[4]);
true
> q:=quo<G1|NL[4]>;
> P:=PGL(2,9);
> s:=IsIsomorphic(q,P);
> s;
true
> #q;
720```
Now we need to find the presentation of $q$. We use \texttt{FPGroup}(q) to find the finitely presented group of $q$.

\begin{verbatim}
> FPGroup(q);
Finitely presented group on 4 generators
Relations
$.1^2 = \text{Id}(\$)
$.2^2 = \text{Id}(\$)
$.3^2 = \text{Id}(\$)
$.4^2 = \text{Id}(\$)
($.1 * $.2)^2 = \text{Id}(\$)
$.1 * $.3 * $.2 * $.3 = \text{Id}(\$)
($.2 * $.4)^2 = \text{Id}(\$)
$.4 * $.1 * $.3 * $.4 * $.1 * $.4 * $.1 * $.4 * $.1 = \text{Id}(\$)
($.1 * $.4 * $.3 * $.4)^3 = \text{Id}(\$)
$.4 * $.3 * $.1 * $.4 * $.3 * $.4 * $.3 * $.1 * $.4 * $.3 * $.2 * $.4 * $.3 * $.4 * $.3 = \text{Id}(\$)
\end{verbatim}

Using the relations given and allowing $.1$, $.2$, $.3$, and $.4$ to be $g$, $h$, $i$, and $j$ respectively, we find the presentation of $q$, denoted by $H$, to be the following.

\begin{verbatim}
> H<g,h,i,j>:=Group<g,h,i,j|g^2,h^2,i^2,j^2, (g*h)^2,(h*j)^2, g*i*h*i, j*g*j*g*j*g, (g*j*i*j)^3, j*i*g*j*i*g*j*i*g-j*i*j*i>; 
\end{verbatim}

We also confirm that the order of $H$ is 720, which is the same as the order of $q$, then we check to see that $H$ is isomorphic to $q$.

\begin{verbatim}
> f1,h1,k1:=CosetAction(H,sub<H|Id(H)>); 
> s:=IsIsomorphic(q,h1); 
> s; 
true 
\end{verbatim}

Next we will look at the transversals of $\text{NL}[4]$. Now let $T_2$, $T_3$, $T_4$, and $T_5$ represent $T[2], T[3], T[4]$, and $T[5]$ respectively. $T[1]$ is the identity and as such does not need to be represented as $T_1$. We will then name them each $g$, $h$, $i$, and $j$ respectively.

\begin{verbatim}
> T2:=T[2]; T3:=T[3]; T4:=T[4]; T5:=T[5]; 
> /* G/\text{NL}[4]= <NT2,NT3,NT4,NT5>; */ 
> g:=T[2]; h:=T[3]; i:=T[4]; j:=T[5]; 
\end{verbatim}
We checked if the order of the relations given above matched the order of the
relations when replaced by the transversals. We learn that \((j*g*j*h*g*j*g) = D^3\)
and \((j*i*g*j*i*j*i*g*j*i*h*j*i*g*i*j*i*j*i) = D^4\). Next we want
to find the action of \(q\) on \(D\). To do so we use the following loops.

\[
\begin{align*}
\text{for } m \text{ in } [1..6] \text{ do if } \overset{D}{g} \text{ eq } \overset{D}{m} \text{ then } m; \text{ end if}; \text{ end for}; \\
1 \\
\text{for } m \text{ in } [1..6] \text{ do if } \overset{D}{h} \text{ eq } \overset{D}{m} \text{ then } m; \text{ end if}; \text{ end for}; \\
1 \\
\text{for } m \text{ in } [1..6] \text{ do if } \overset{D}{i} \text{ eq } \overset{D}{m} \text{ then } m; \text{ end if}; \text{ end for}; \\
1 \\
\text{for } m \text{ in } [1..6] \text{ do if } \overset{D}{j} \text{ eq } \overset{D}{m} \text{ then } m; \text{ end if}; \text{ end for}; \\
5
\end{align*}
\]

Therefore we note that \(D^g = D\), \(D^h = D\), \(D^i = D\), \(D^j = D^5\). So now we have
the presentation of \(D\) and \(q\). We check that the order of \(G\) is equal to the order of our
extension problem.

\[
\begin{align*}
\text{G}<d,g,h,i,j>:=\text{Group}<d,g,h,i,j|d^6,g^2,h^2,i^2,j^2,(g*h)^2,(h*j)^2, g*i*h*i, j*g*j*h*g*j*g*d^3, (g*j*i*j)^3, j*i*g*j*i*g*j*i*h*j*i*g*i*j*i*i*d^4, d^g=d, d^h=d, d^i=d, d^j=d^5>;
\end{align*}
\]

\[
\begin{align*}
\#G; \\
4320 \\
f2,g2,k2:=\text{CosetAction}(G,\text{sub}<G|\text{Id}(G)>); \\
\#g2; \\
4320 \\
s:=\text{IsIsomorphic}(G1,g2); \\
s; \\
true
\end{align*}
\]

As we can see above, the presentation we derived from the composition factors
proved to be isomorphic to our extension problem. So the isomorphic image we get here
is \(6 \cdot PGL_2(9)\).
Chapter 4

Wreath Product Progenitors

4.1 Preliminaries

**Definition 4.1** (Wreath Product). Let $H$ and $K$ be permutation groups on $X$ and $Y$ respectively then $Z = X \times Y$ where $Z = \{(x, y)|x \in X, y \in Y\}$ and $X \cap Y = \emptyset$. If a permutation group is defined on $Z$ then we call this the Wreath Product of $H$ by $K$, denoted $H \wr K$. Define $H \leq S_X$ and $K \leq S_Y$.

**Definition 4.2.** Let $\gamma \in H$ and $y$ be a fixed element of $Y$ defined $\gamma(y) : \{(x, y) \mapsto ((x)\gamma, y), (x, y_1) \mapsto (x, y_1) \text{ if } y_1 \neq y\}$.

**Definition 4.3.** If $k \in K$ then $k^* : (x, y) \mapsto (x, (y)k)$.

**Definition 4.4.** If $\gamma(y)$ and $k^*$ are permutations of $S_Z$ then

$$\phi : H \rightarrow S_Z \text{ given by } \gamma \mapsto \gamma(y),$$

where $\phi$ is 1-1 and a homomorphism. Then the image

$$\phi(H) = \{\gamma(y)|\gamma \in H\} = H(y).$$

And $\psi : K \rightarrow S_Z \text{ given by } k \mapsto k^*$,

where $\psi$ is also 1-1 and a homomorphism. Then $\psi(k) = k^* = \{k^*|k \in K\}$.

**Theorem 4.5.** The wreath product of the group $H$ by $K$, denoted $H \wr K$ is the semi-direct product $H^n : K$, where $n$ is the number of letters on which $K$ acts and $H^n$ is the direct copies of $H$. $K$ permutes the $n$ isomorphic copies of $H$. 
\[ H \wr K = \{ H(y), K^* | y \in Y \} \]
\[ H \wr K = \prod H(y) : K^* \]

**Definition 4.6 (Base).** The base of the wreath product is the direct copies of \( H \), denoted \( \prod H(y) \).

### 4.2 Construction of the Wreath Product \( 2^8 \cdot \mathbb{Z}_4 \wr \mathbb{Z}_2 \)

Let \( H \) and \( K \) be permutation groups on \( X \) and \( Y \), respectively. The wreath product of the group \( H \) by \( K \), denoted by \( H \wr K \), is the semi-direct product \( H^n : K \), where \( n \) is the number of letters on which \( K \) acts and \( H^n \) is the direct product of \( n \) copies of \( H \). Then \( K \) permutes the \( n \) copies of \( H \) for a semi-direct product. Let \( Z = \{(x, y) | x \in X, y \in Y \} \). We will define a permutation group on \( Z \), the wreath product of \( H \) by \( K \).

To show an example we will find the wreath product \( \mathbb{Z}_4 \wr \mathbb{Z}_2 \).

Let \( H = \mathbb{Z}_7 = \langle e, (1,2,3,4) \rangle \) and \( K = \mathbb{Z}_2 = \langle e, (5,6) \rangle \), where \( X = \{1,2,3,4\} \) and \( Y = \{5,6\} \). Now \( Z = \{(x, y) | x \in X, y \in Y \} \). We can easily find that \( Z = \{(1,5), (1,6), (2,5), (2,6), (3,5), (3,6), (4,5), (4,6)\} \).

Let \( \gamma \in H \) and \( y \) be a fixed element of \( Y \). Define \( \gamma(y) : \{(x, y) \mapsto ((x) \gamma, y), (x, y_1) \mapsto (x, y_1) \text{ if } y_1 \neq y \} \).

| Table 4.1: Mapping of \( \gamma(5) \) |
|------------------|-----------|
| 1  | (1,5)   | (2,5) | 3 |
| 2  | (1,6)   | (1,6) | 2 |
| 3  | (2,5)   | (3,5) | 5 |
| 4  | (2,6)   | (2,6) | 4 |
| 5  | (3,5)   | (4,5) | 7 |
| 6  | (3,6)   | (3,6) | 6 |
| 7  | (4,5)   | (1,5) | 1 |
| 8  | (4,6)   | (4,6) | 8 |

So \( \gamma(5) = (1,3,5,7) \) and similarly we find \( \gamma(6) = (2,4,6,8) \). Now let \( k \in K \) and define \( k^* : (x, y) \mapsto (x, (y)k) \).
Table 4.2: Mapping of $k^* = (5, 6)^*$

</table>

So we see that $k^* = (1, 2)(3, 4)(5, 6)(7, 8)$. We know that the presentation for $\mathbb{Z}_2^2 = \langle a | a^4 \rangle \times \langle b | b^4 \rangle$ and the presentation for $\mathbb{Z}_2 = \langle u | u^2 \rangle$. Let $a = (1, 3, 5, 7)$, $b = (2, 4, 6, 8)$, and $u = (1, 2)(3, 4)(5, 6)(7, 8)$. Finding the action of $\mathbb{Z}_2$ on $\mathbb{Z}_4$ in words we get:

$$a^x = b, \ b^x = a$$

Using the information we gathered we can now find the wreath product presentation:

$$\mathbb{Z}_4 \wr \mathbb{Z}_2 = \langle a, b, u | a^4, b^4, (a, b), u^2, a^u = b, b^u = a \rangle$$

We confirm this presentation is isomorphic to the wreath product using MAGMA.

From here we introduce a new variable $t$, let $t = t_1$ and we note that the stabilizer of $1$ in $\mathbb{Z}_4 \wr \mathbb{Z}_2$ is

$$< (2, 4, 6, 8) >$$

Thus $t$ commutes with $e, b, b^2, b^3$.

Finally we find that the presentation for the progenitor is

$$2^8 : \mathbb{Z}_4 \wr \mathbb{Z}_2 = \langle a, b, u, t | a^4, b^4, (a, b), u^2, a^u = b, b^u = a, t^2, (t, b) \rangle$$

By adding the following relations to the progenitor we get the images given below.

$$(u * t)^i, (u * a * t * t^u)^j, (a * t * t^a)^k, (a * u * t^u^2 * t^u * t)^l, (a * u * t^u^2 * t^a * t)^m$$

4.3 Wreath Product Progenitor $2^*_{10} : \mathbb{Z}_2 \wr S_5$

For another example we will find the wreath product $\mathbb{Z}_2 \wr S_5$.

Let $H = \mathbb{Z}_2 = \langle e, (1,2) \rangle$ and $K = S_5 = \langle (3,4,5,6,7), (3,4) \rangle$, where $X = \{1,2\}$ and $Y = \{3,4,5,6,7\}$. Now $Z = \{(x,y)|x \in X, y \in Y\}$. We can easily find that $Z = \{(1,3), (1,4), (1,5), (1,6), (1,7), (2,3), (2,4), (2,5), (2,6), (2,7)\}$.

Let $\gamma \in H$ and $y$ be a fixed element of $Y$. Define $\gamma(y) : \{(x,y) \mapsto ((x)\gamma, y), (x,y_1) \mapsto (x,y_1) \text{ if } y_1 \neq y\}$.

<table>
<thead>
<tr>
<th>Table 4.5: Mapping of $\gamma(3)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>5</td>
</tr>
<tr>
<td>6</td>
</tr>
<tr>
<td>7</td>
</tr>
<tr>
<td>8</td>
</tr>
<tr>
<td>9</td>
</tr>
<tr>
<td>10</td>
</tr>
</tbody>
</table>

So $\gamma(3) = (1,6)$, and similarly we find $\gamma(4) = (2,7), \gamma(5) = (3,8), \gamma(6) = (4,9)$, and $\gamma(7) = (5,10)$. Now let $k \in K$ and define $k^* : (x,y) \mapsto (x,(y)k)$.

<table>
<thead>
<tr>
<th>Table 4.6: Mapping of $k^* = (3,4,5,6,7)^*$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>5</td>
</tr>
<tr>
<td>6</td>
</tr>
<tr>
<td>7</td>
</tr>
<tr>
<td>8</td>
</tr>
<tr>
<td>9</td>
</tr>
<tr>
<td>10</td>
</tr>
</tbody>
</table>

So $k_1^* = (1,2,3,4,5)(6,7,8,9,10)$ and $k_2^* = (1,2)(6,7)$. We know that the
presentation for $\mathbb{Z}_2^5 = < a | a^2 > \times < b | b^2 > \times < c | c^2 > \times < d | d^2 > \times < e | e^2 >$ and the presentation for $S_5 = < u, v | u^5, v^2, (uv)^4, (u, v)^3 >$. Let $a = (1, 6), b = (2, 7), c = (3, 8), d = (4, 9), e = (5, 10), u = (1, 2, 3, 4, 5)(6, 7, 8, 9, 10),$ and $v = (1, 2)(6, 7)$. Finding the action of $S_5$ on $\mathbb{Z}_2$ in words we get:

$$a^u = b, \ b^u = c, \ c^u = d, \ d^u = e, \ e^u = a$$
$$a^v = b, \ b^v = a, \ c^v = c, \ d^v = d, \ e^v = e$$

Using the information we gathered we can now find the wreath product presentation:

$$\mathbb{Z}_2 \wr S_5 = < a, b, c, d, e, u, v | a^2, b^2, c^2, d^2, e^2, (a, b), (a, c), (a, d), (a, e), (b, c), (b, d), (b, e), (c, d), (c, e), (d, e), u^5, v^2, (uv)^4, (u, v)^3, a^u = b, b^u = c, c^u = d, d^u = e, e^u = a, a^v = b, b^v = a, c^v = c, d^v = d, e^v = e >$$

We confirm this presentation is isomorphic to the wreath product using MAGMA. From here we introduce a new variable $t$, let $t = t_1$ and we note that the stabilizers of 1 in $\mathbb{Z}_2 \wr S_5$ are

$$(2, 7)$$
$$(3, 8)$$
$$(4, 9)$$
$$(5, 10)$$
$$\langle 4, 10 \rangle (5, 9)$$
$$\langle 3, 4, 10 \rangle (5, 8, 9)$$
$$\langle 2, 10, 9 \rangle (4, 7, 5)$$
$$\langle 2, 10 \rangle (5, 7)$$

Thus $t$ commutes with $b, c, d, e$, however we need to use the Schreier System in MAGMA to find that $t$ also commutes with $(d * e * u^2 * v * u^{-2}), (d * e * v * u * v^{-1} * u * v), (b * d * v * u^{-2} * v * u), (b * e * v * u * v * u^{-1})$.

Finally we find that the presentation for the progenitor is

$$2^{10} : \mathbb{Z}_2 \wr S_5 = < a, b, c, d, e, u, v, t | a^2, b^2, c^2, d^2, e^2, (a, b), (a, c), (a, d), (a, e), (b, c), (b, d), (b, e), (c, d), (c, e), (d, e), u^5, v^2, (uv)^4, (u, v)^3, a^x = b, b^x = c, c^x = d, d^x = e, e^x = a, a^y = b, b^y = a, c^y = c, d^y = d, e^y = e, t^2, (t, b), (t, c), (t, d), (t, e), (t, d * e * u^2 * v * u^{-2}), (t, d * e * v * u * v^{-1} * u * v), (t, b * d * v * u^{-2} * v * u), (t, b * e * v * u * v * u^{-1} * v) >$$
By adding the following relations to the progenitor we get the images given below.

\[(a \ast t^a)^i, (u \ast a \ast t \ast t^u)^j, (v \ast a \ast t \ast t^v)^k, (a \ast u \ast v \ast t^u \ast t^v)^l, (a \ast u \ast v \ast t^u \ast t^v)^m\]

Table 4.8: Progenitors of 2\ast^{10} : Z_2 \wr S_5 where Kernel > 1

4.4 Wreath Product Progenitor 2\ast^{12} : Z_3 \wr S_4

For another example we will find the wreath product Z_3 \wr S_4.

Let \( H = Z_3 = \langle e, (1, 2, 3) \rangle \) and \( K = S_5 = \langle (4, 5, 6, 7), (4, 5) \rangle \), where \( X = \{1, 2, 3\} \) and \( Y = \{4, 5, 6, 7\} \). Now \( Z = \{(x, y) | x \in X, y \in Y\} \). We can easily find that \( Z = \{(1, 4), (1, 5), (1, 6), (1, 7), (2, 4), (2, 5), (2, 6), (2, 7), (3, 4), (3, 5), (3, 6), (3, 7)\}\).

Let \( \gamma \in H \) and \( y \) be a fixed element of \( Y \). Define \( \gamma(y) : \{(x, y) \mapsto ((x)\gamma, y), (x, y_1) \mapsto (x, y_1) \text{ if } y_1 \neq y\} \).

So \( \gamma(4) = (1, 5, 9) \), and similarly we find \( \gamma(5) = (2, 6, 10) \), \( \gamma(6) = (3, 7, 11) \), and lastly \( \gamma(7) = (4, 8, 12) \). Now let \( k \in K \) and define \( k^* : (x, y) \mapsto (x, (y)k) \).

So \( k_1^* = (1, 2, 3, 4)(5, 6, 7, 8)(9, 10, 11, 12) \) and \( k_2^* = (1, 2)(5, 6)(9, 10) \). We know that the presentation for \( Z_3^4 = \langle a^2, b^3 \rangle \times \langle c^3 \rangle \times \langle d^3 \rangle \) and the presentation for \( S_5 = \langle u, v | a^4, v^2, (uv)^3 \rangle \). Let \( a = (1, 5, 9), b = (2, 6, 10), c = (3, 7, 11), d = (4, 8, 10), u = (1, 2, 3, 4)(5, 6, 7, 8)(9, 10, 11, 12) \), and \( v = (1, 2)(5, 6)(9, 10) \). Finding the action of \( S_4 \) on \( Z_3 \) in words we get:
Table 4.9: Mapping of $\gamma(4)$

|   | (1,4) → (2,4) |   | (1,5) → (1,5) |   | (1,6) → (1,6) |   | (1,7) → (1,7) |   | (2,4) → (3,4) |   | (2,5) → (2,5) |   | (2,6) → (2,6) |   | (2,7) → (2,7) |   | (3,4) → (1,4) |   | (3,5) → (3,5) |   | (3,6) → (3,6) |   | (3,7) → (3,7) |   |
|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|
| 1 | (1,4) → (2,4) | 5 | (1,5) → (1,5) | 2 | (1,6) → (1,6) | 3 | (1,7) → (1,7) | 4 | (2,4) → (3,4) | 9 | (2,5) → (2,5) | 6 | (2,6) → (2,6) | 7 | (2,7) → (2,7) | 8 | (3,4) → (1,4) | 1 | (3,5) → (3,5) | 10 | (3,6) → (3,6) | 11 | (3,7) → (3,7) | 12 |

Table 4.10: Mapping of $k^* = (4, 5, 6, 7)^*$

|   | (1,4) → (1,5) |   | (1,5) → (1,6) |   | (1,6) → (1,7) |   | (1,7) → (1,4) |   | (2,4) → (2,5) |   | (2,5) → (2,6) |   | (2,6) → (2,7) |   | (2,7) → (2,4) |   | (3,4) → (3,5) |   | (3,5) → (3,6) |   | (3,6) → (3,7) |   | (3,7) → (3,4) |   |
|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|----------------|---|
| 1 | (1,4) → (1,5) | 5 | (1,5) → (1,6) | 2 | (1,6) → (1,7) | 3 | (1,7) → (1,4) | 4 | (2,4) → (2,5) | 9 | (2,5) → (2,6) | 6 | (2,6) → (2,7) | 7 | (2,7) → (2,4) | 8 | (3,4) → (3,5) | 1 | (3,5) → (3,6) | 10 | (3,6) → (3,7) | 11 | (3,7) → (3,4) | 12 |
Using the information we gathered we can now find the wreath product presentation:

\[ Z_3 \wr S_4 = \langle a, b, c, d, u, v | a^3, b^3, c^3, d^3, (a, b), (a, c), (a, d), (b, c), (b, d), (c, d), u^4, v^2, (uv)^3, \\
 a^u = b, b^u = c, c^u = d, d^u = a, a^v = b, b^v = a, c^v = d, d^v = d \rangle \]

We confirm this presentation is isomorphic to the wreath product using MAGMA.

From here we introduce a new variable \( t \), let \( t = t_1 \) and we note that the stabilizers of 1 in \( Z_3 \wr S_4 \) are

\[ (2,6,10), (3,7,11), (4,8,10), (2,3)(4,12)(6,7)(10,11), (2,3,12,10,11,8,6,7,4), (2,4,10,12,6,8) \]

Thus \( t \) commutes with \( e, b, b^2, c, c^2, d \) and \( d^2 \), however we need to use the Schreier System in MAGMA to find that \( t \) also commutes with \( (d^{-1} * u^{-1} * v * u), (u * v * d^{-1}), (v * u^2 * v * u * b^{-1}) \).

Finally we find that the presentation for the progenitor is

\[ 2^{12} : Z_3 \wr S_4 = \langle \\
 a, b, c, d, u, v, t | a^3, b^3, c^3, d^3, (a, b), (a, c), (a, d), (b, c), (b, d), (c, d), u^4, v^2, (uv)^3, \\
 a^u = b, b^u = c, c^u = d, d^u = a, a^v = b, b^v = a, c^v = c, d^v = d, t^2, (t, b), (t, c), (t, d), \\
 (t, d^{-1} * u^{-1} * v * u), (t, u * v * d^{-1}), (t, v * u^2 * v * u * b^{-1}) \rangle \]

By adding the following relations to the progenitor we get the images given below.

\[ (a * t^a)^i, (u * a * t * t^u)^j, (v * a * t * t^v)^k, (a * u * v * t^2 * t^u * t^v)^l, (a * u * v * t * u^2 * t^a * t)^m \]

### 4.5 Wreath Product Progenitor \( 2^{14} : Z_7 \wr Z_2 \)

For another example we will find the wreath product \( Z_7 \wr Z_2 \).

Let \( H = Z_7 = \langle e, (1,2,3,4,5,6,7) \rangle \) and \( K = Z_2 = \langle e, (8,9) \rangle \), where \( X = \]
Now let $a \in \mathbb{Z}$ be a fixed element of $\mathbb{Z}$. Define $y = (1,4) \rightarrow \gamma = (8)$. Let $\gamma \in H$ and $y$ be a fixed element of $Y$. Define $\gamma(y) : \{(x,y) \mapsto ((x)\gamma,y), (x,y_1) \mapsto (x,y_1) \text{ if } y_1 \neq y\}$. 

\begin{table}[h]
\centering
\caption{Homomorphic Images of $2^{*12} : \mathbb{Z}_3 / S_4$}
\begin{tabular}{cccccccc}
\hline
i & j & k & l & m & Index & Order of G & Isomorphic Type \\
\hline
0 & 0 & 2 & 6 & 7 & 91 & 2184 & $PGL_2(13)$ \\
0 & 0 & 6 & 0 & 4 & 10 & 240 & $2 \times S_5$ \\
0 & 0 & 6 & 3 & 6 & 256 & 497264 & $2^{8} : [(3^3 \times 3) : S_4]$ \\
\hline
\end{tabular}
\end{table}

\begin{table}[h]

\caption{Progenitors of $2^{*12} : \mathbb{Z}_3 / S_4$, where $Kernel > 1$}
\begin{tabular}{cccccccc}
\hline
i & j & k & l & m & Index & Order of G & Kernel \\
\hline
0 & 3 & 0 & 0 & 0 & 14 & 336 & 3 \\
\hline
\end{tabular}
\end{table}

\{1,2,3,4,5,6,7\} and $Y = \{8,9\}$. Now $Z = \{(x,y) | x \in X, y \in Y\}$. We can easily find that $Z = \{(1,8),(1,9),(2,8),(2,9),(3,8),(3,9),(4,8),(4,9),(5,8)(5,9),(6,8),(6,9),(7,8),(7,9)\}$. 

Let $\gamma \in H$ and $y$ be a fixed element of $Y$. Define $\gamma(y) : \{(x,y) \mapsto ((x)\gamma,y), (x,y_1) \mapsto (x,y_1) \text{ if } y_1 \neq y\}$. 

\begin{table}[h]
\centering
\caption{Mapping of $\gamma(8)$}
\begin{tabular}{cccc}
\hline
1 & (1,8) & $\rightarrow$ & (2,8) \\
2 & (1,9) & $\rightarrow$ & (1,9) \\
3 & (2,8) & $\rightarrow$ & (3,8) \\
4 & (2,9) & $\rightarrow$ & (2,9) \\
5 & (3,8) & $\rightarrow$ & (4,8) \\
6 & (3,9) & $\rightarrow$ & (3,9) \\
7 & (4,8) & $\rightarrow$ & (5,8) \\
8 & (4,9) & $\rightarrow$ & (4,9) \\
9 & (5,8) & $\rightarrow$ & (6,8) \\
10 & (5,9) & $\rightarrow$ & (5,9) \\
11 & (6,8) & $\rightarrow$ & (7,8) \\
12 & (6,9) & $\rightarrow$ & (6,9) \\
13 & (7,8) & $\rightarrow$ & (1,8) \\
14 & (7,9) & $\rightarrow$ & (7,9) \\
\hline
\end{tabular}
\end{table}

So $\gamma(8) = (1,3,5,7,9,11,13)$ and similarly we find $\gamma(9) = (2,4,6,8,10,12,14)$. 

Now let $k \in K$ and define $k^{*} : (x,y) \mapsto (x,(y)k)$. 

So we see that $k^{*} = (1,2)(3,4)(5,6)(7,8)(9,10)(11,12)(13,14)$. We know that the presentation for $\mathbb{Z}_2^{2} = < a | a^7 > \times < b | b^7 >$ and the presentation for $\mathbb{Z}_2 = < u | u^2 >$. 

Let $a = (1,3,5,7,9,11,13), b = (2,4,6,8,10,12,14)$, and $u = (1,2)(3,4)(5,6)(7,8)(9,10)(11,12)$.

(13, 14). Finding the action of $\mathbb{Z}_2$ on $\mathbb{Z}_7$ in words we get:

$$a^u = b, \ b^u = a$$

Using the information we gathered we can now find the wreath product presentation:

$$\mathbb{Z}_7 \wr \mathbb{Z}_2 = < a, b, u | a^7, b^7, (a, b), u^2, a^u = b, b^u = a >$$

We confirm this presentation is isomorphic to the wreath product using MAGMA.

From here we introduce a new variable $t$, let $t = t_1$ and we note that the stabilizer of 1 in $\mathbb{Z}_7 \wr \mathbb{Z}_2$ is

$$< (2, 4, 6, 8, 10, 12, 14) >$$

Thus $t$ commutes with only $e, b, b^2, b^3, b^4, b^5,$ and $b^6$.

Finally we find that the presentation for the progenitor is

$$2^{14} : \mathbb{Z}_7 \wr \mathbb{Z}_2 = < a, b, u, t | a^7, b^7, (a, b), u^2, a^u = b, b^u = a, t^2, (t, b) >$$

By adding the following relations to the progenitor we get the images given below.

$$(u \ast t \ast a)^i, (u \ast t^a)^i, (a \ast t \ast t^a)^k, (u \ast a \ast t \ast a^2)^l, (a^3 \ast t^u \ast t^a)^m$$

4.6 Wreath Product Progenitor $2^* \times \mathbb{Z}_3$

For another example we will find the wreath product $\mathbb{Z}_5 \wr \mathbb{Z}_3$.

Let $H = \mathbb{Z}_5 = \langle e, (1, 2, 3, 4, 5) \rangle$ and $K = \mathbb{Z}_3 = \langle e, (6, 7, 8) \rangle$, where $X = \{1, 2, 3, 4, 5\}$ and $Y = \{6, 7, 8\}$. Now $Z = \{(x, y) | x \in X, y \in Y\}$. We can easily find that $Z = \{(1, 6), (1, 7), (1, 8), (2, 6), (2, 7), (2, 8), (3, 6), (3, 7), (3, 8), (4, 6), (4, 7), (4, 8), (5, 6), (5, 7), (5, 8)\}$.

Let $\gamma \in H$ and $y$ be a fixed element of $Y$. Define $\gamma(y) = \{(x, y) | (x) \gamma, (x, y_1) \mapsto (x, y_1) \text{ if } y_1 \neq y\}$.

| Table 4.16: Mapping of $\gamma(6)$ |
|---|---|---|---|
| 1 | (1,6) | (2,6) | 4 |
| 2 | (1,7) | (1,7) | 2 |
| 3 | (1,8) | (1,8) | 3 |
| 4 | (2,6) | (3,6) | 7 |
| 5 | (2,7) | (2,7) | 5 |
| 6 | (2,8) | (2,8) | 6 |
| 7 | (3,6) | (4,6) | 10 |
| 8 | (3,7) | (3,7) | 8 |
| 9 | (3,8) | (3,8) | 9 |
| 10 | (4,6) | (5,6) | 13 |
| 11 | (4,7) | (4,7) | 11 |
| 12 | (4,8) | (4,8) | 12 |
| 13 | (5,6) | (1,6) | 1 |
| 14 | (5,7) | (5,7) | 14 |
| 15 | (5,8) | (5,8) | 15 |

So $\gamma(6) = (1, 4, 7, 10, 13)$ and similarly we find $\gamma(7) = (2, 5, 8, 11, 14)$ and $\gamma(8) = (3, 6, 9, 12, 15)$. Now let $k \in K$ and define $k^* : (x, y) \mapsto (x, (y)k)$.
Table 4.17: Mapping of \( k^* = (6, 7, 8)^* \)

</tbody>
</table>

So we see that \( k^* = (1, 2, 3)(4, 5, 6)(7, 8, 9)(10, 11, 12)(13, 14, 15) \). We know that the presentation for \( \mathbb{Z}_5^3 = < a^5 > \times < b^5 > \times < c^5 > \) and the presentation for \( \mathbb{Z}_3 = < u^3 > \). Let \( a = (1, 4, 7, 10, 13), b = (2, 5, 8, 11, 14), c = (3, 6, 9, 12, 15), \) and \( u = (1, 2, 3)(4, 5, 6)(7, 8, 9) (10, 11, 12)(13, 14, 15) \). Finding the action of \( \mathbb{Z}_3 \) on \( \mathbb{Z}_5 \) in words we get:

\[
a^u = b, \quad b^u = c, \quad c^u = a
\]

Using the information we gathered we can now find the wreath product presentation:

\[
\mathbb{Z}_5 \wr \mathbb{Z}_3 = < a, b, c, u^3, b^5, a^5, (a, b), (a, c), (b, c), u^3, a^u = b, b^u = c, c^u = a >
\]

We confirm this presentation is isomorphic to the wreath product using MAGMA.

From here we introduce a new variable \( t \), let \( t = t_1 \) and we note that the stabilizers of \( 1 \) in \( \mathbb{Z}_5 \wr \mathbb{Z}_3 \) are

\[
< (2, 5, 8, 11, 14) >
\]

\[
< (3, 6, 9, 12, 15) >
\]

Thus \( t \) commutes with only \( e, b, b^2, b^3, b^4, c, c^2, c^3 \) and \( c^4 \).

Finally we find that the presentation for the progenitor is
$2^{15} : \mathbb{Z}_5 \wr \mathbb{Z}_3 = \langle a, b, c, u, t | a^5, b^5, c^5, (a, b), (a, c), (b, c), u^3, a^u = b, b^u = c, c^u = a, t^2, (t, b), (t, c) \rangle$

By adding the following relations to the progenitor we get the images given below.

$$(a \ast t^a)^i, (u \ast a \ast t \ast t^u)^j, (a \ast t \ast t^a)^k, (a \ast u \ast t^u \ast t^u \ast t)^l, (a \ast u \ast t^u \ast t^a \ast t)^m$$

Chapter 5

Monomial Progenitors

In this chapter we will discuss the full automorphism group of $\text{Aut}(m^n)$. We will prove that $\text{Aut}(m^n) = U_m \wr S_n$, whose order is $(\phi(m))^n \cdot n!$. Afterwards we will show a few examples. Let us first recall some definitions.

5.1 Preliminaries

Definition 5.1 (Direct Product). Let $H$ and $K$ be subgroups of $G$. We say that $G$ is a direct product of $H$ by $K$, denoted $H \times K$, if the following are true.

1. $H$ and $K$ are both normal in $G$
2. $H \cap K = 1$

Definition 5.2 (Semi-Direct Product). Let $H$ and $K$ be subgroups of $G$. We say that $G$ is a semi-direct product of $H$ by $K$, denoted $H : K$, if the following are true.

1. $H$ is normal in $G$
2. $H \cap K = 1$

Definition 5.3 (Wreath Product). Let $D$ and $Q$ be groups, let $\Omega$ be a finite $Q$-set, let $\{D_w : w \in \Omega\}$ be a family of isomorphic copies of $D$ indexed by $\Omega$ and let $K = \Pi_{w \in \Omega} D_w$, where $\Pi_{w \in \Omega} D_w$ denotes the direct product of $D_w$'s, and $D_w \cong D$ for all $w \in \Omega$. Then the wreath product of $D$ by $Q$ denoted by $D \wr Q$ (or by $D \text{ wr } Q$), is the semi-direct product
of \( K \) by \( Q \), where \( Q \) acts on \( K \) by \( q \cdot (d_w) = (d_{qw}) \) for \( q \in Q \) and \( (d_w) \in \Pi_{w \in \Omega} D_w \). The normal subgroup \( K \) of \( D \wr Q \) is called the base of the wreath product. [?] \n
5.2 The full automorphism group \( \text{Aut}(m^*n) \).

We first count the number of automorphisms in this group. We fix a \( t_i \), say \( t_1 \), and map it to its \( \phi(m) \) powers that are relatively prime to \( m \) while keeping \( t_2, t_3, \ldots, t_n \) fixed. This gives \( \phi(m) \) automorphisms of \( \text{Aut}(m^*n) \). Moreover, these \( \phi(m) \) automorphisms form a subgroup of \( \text{Aut}(m^*n) \) isomorphic to \( U(m) \), the group of positive integers less than \( m \) and relatively prime to \( m \) under multiplication modulo \( m \). Call this subgroup of \( \text{Aut}(m^*n) \), \( U_{t_1}(m) \). Now, each of these \( \phi(m) \) automorphisms of \( U_{t_1}(m) \) gives another \( \phi(m) \) automorphisms when \( t_2 \) is mapped to its \( \phi(m) \) powers that are relatively prime to \( m \). Thus, we have seen \( (\phi(m))^2 \) automorphisms in \( \text{Aut}(m^*n) \). We repeat the process with \( t_3, t_4, \ldots, t_n \) and obtain \( (\phi(m))^n \) automorphisms of \( \text{Aut}(m^*n) \). If we now multiply each of these \( (\phi(m))^n \) automorphisms by the \( n! \) automorphisms generated by \( t_1 \mapsto t_2, t_2 \mapsto t_1, t_1 \mapsto t_3, t_3 \mapsto t_1, \ldots, t_1 \mapsto t_n, t_n \mapsto t_1 \), we obtain \( (\phi(m))^n \times n! \) automorphisms of \( \text{Aut}(m^*n) \).

We note that the \( (\phi(m))^n \) automorphisms of \( \text{Aut}(m^*n) \) give the subgroup \( B = \langle U_{t_1}(m), U_{t_2}(m), \ldots, U_{t_n}(m) \rangle \). We show that \( B = \Pi_i U_{t_i}(m) \), a direct product of \( U_{t_1}(m), U_{t_2}(m), \ldots, U_{t_n}(m) \). We note that \( U_{t_i}(m)^{U_{t_j}(m)} = U_{t_i}(m) \) for \( i \neq j \) since, for \( a, b \in \{1, 2, \ldots, m-1\} \) and \( \gcd(a,m) = 1 \) and \( \gcd(b,m) = 1 \), \( (t_i \mapsto t_i^a)(t_j \mapsto t_j^b) = t_i \mapsto t_i^a \) and \( U_{t_i}(m)^{U_{t_i}(m)} = U_{t_i}(m) \). So \( U_{t_i}(m) \) is normal in \( B \), for each \( i \). Also, \( U_{t_i}(m) \cap < U_{t_j}(m) | i \neq j > = 1 \) since an automorphism of the form \( t_i \mapsto t_i^a \in < U_{t_i}(m) | i \neq j > \iff a = 1 \). Thus, \( B = \Pi_i U_{t_i}(m) \), a direct product of \( U_{t_1}(m), U_{t_2}(m), \ldots, U_{t_n}(m) \).

Let \( K \) be the subgroup of \( \text{Aut}(m^*n) \) generated by the \( n \) automorphisms \( < t_1 \mapsto t_2, t_2 \mapsto t_1; t_1 \mapsto t_3, t_3 \mapsto t_1; \ldots; t_1 \mapsto t_n, t_n \mapsto t_1 > \). This group is isomorphic to \( S_n \), the symmetric group of degree \( n \) on \( \{1, 2, \ldots, n\} \). We now show that \( \text{Aut}(m^*n) = < B, K > \) is a semi-direct product of \( B \) by \( K \). Let \( t_i \mapsto t_i^a \in B \) (as defined above) and \( [t_1 \mapsto t_i, t_i \mapsto t_1] \in K \). Then \( (t_i \mapsto t_i^a)[t_1 \mapsto t_i, t_i \mapsto t_1] = t_1 \mapsto t_1^a \in B \) and the automorphisms of \( B \) in \( K \) permute \( U_{t_i} \)’s. Thus \( B \) is normal in \( K \). Note that \( B \cap K = 1 \) since \( B \) contains automorphisms of the form \( t_i \mapsto t_i^a \) and \( K \) contains automorphisms of the form \( t_i \mapsto t_j, t_j \mapsto t_i \). Thus \( B \) is normal in \( K \) and \( B \cap K = 1 \). Hence, \( \text{Aut}(m^*n) \cong (B : K) = \)
\[ U_t(m) \wr K = U(m) \wr S_n. \]

### 5.3 Example \( Aut(3^{*2}) \)

Give the full automorphism group \( Aut(3^{*2}) \). To find the automorphisms of \( m^{*n} \) we first select a \( t_i \) to raise to a power of itself that is relatively prime to \( m \). All other \( t \)'s shall be fixed.

To show the process described we will give an example of finding the group of all monomial automorphisms, \( Aut(3^{*2}) \). We know that \( 3^{*2} \) is on two letters, \( t_1 \) and \( t_2 \), each of which is of order 3. Now \( U(3) = \{1, 2\} \) is a group under multiplication mod 3 and is the set of numbers that are coprime to 3 since \( U(n) = \{a | 1 \leq a \leq n, \gcd(a, n) = 1\} \). We will now choose a \( t \), say \( t_1 \) to send to \( t_1^1 = t_1 \) and fix all other \( t \)'s. Similarly the second mapping sends \( t_1 \rightarrow t_1^2 \).

So we have two automorphisms. Next we will take these two mappings and for each we will send \( t_2 \rightarrow t_2^2 \) while keeping everything else fixed. This will give us two more automorphisms. At this point we have a total of four automorphisms. To complete the group \( M \) permutate our \( t \)'s, thus sending \( t_1 \rightarrow t_2 \) and \( t_2 \rightarrow t_1 \), giving us four more automorphisms.

The first two automorphisms we found represent the group \( U_1(3) \) which is of order 2. Then we found the next set of automorphisms that represent another group \( U_2(3) \). We find the last four automorphisms by permutating our group by \( S_2 \), doubling the four that we already had which completes our group \( Aut(3^{*2}) \), bringing the order of \( Aut(3^{*2}) \) to 8, \( (2 \times 2 \times 2) \). We see that \( Aut(3^{*2}) \cong U(3) \wr S_2 \).

$(1,4)(2,3)$
5.4 Example $Aut(5^*2)$

Here is another example of finding the group of all monomial automorphisms, $M$, of $5^*2$. We know that $5^*2$ is on two letters, $t_1$ and $t_2$, each of which is of order 5. Now $U(5) = \{1, 2, 3, 4\}$ is a group under multiplication mod 5 and is the set of numbers that are coprime to 5 since $U(n) = \{a | 1 \leq a \leq n, gcd(a, n) = 1\}$. We will now choose a $t$, say $t_1$ to send to $t_1^1 = t_1$ and fix all other $t$'s. Similarly the second, third and fourth mappings send $t_1 \rightarrow t_1^2$, $t_1 \rightarrow t_1^3$, and $t_1 \rightarrow t_1^4$.

So we have four automorphisms. Next we will take these four mappings and for each we will send $t_2 \rightarrow t_2^2$, while keeping everything else fixed. We will repeat this process by sending $t_2 \rightarrow t_2^3$ and again for $t_2 \rightarrow t_2^4$. This will give us four times the number of automorphisms. At this point we have a total of sixteen automorphisms ($4 \times 4$). To complete the group $M$ we will take all sixteen mappings and will change all the $t_1$'s on the right to $t_2$'s and all $t_2$'s will become $t_1$'s. This will give us sixteen more automorphisms and will complete our group $M$.

The first two automorphisms we found represent the group $U(5)$ which is of order 4. Then we found the next set of automorphisms that represent another group $U(5)$. When we find the last set of automorphisms we double the sixteen that we already had which completes our group $M$, bringing the order of $M$ to $32$, ($4 \times 4 \times 2$). When we find the isomorphism type of $M$ we see that it is the wreath product $U(5) \wr S_2$.

5.5 Example $\text{Aut}(3^*3)$

Here is another example of finding the group of all monomial automorphisms, $M$, of $3^*3$. We know that $3^*3$ is on three letters, $t_1$, $t_2$ and $t_3$, each of which is of order 3. Now $U(3) = \{1, 2\}$ is a group under multiplication mod 3 and is the set of numbers that are coprime to 3 since $U(n) = \{a|1 \leq a \leq n, \gcd(a, n) = 1\}$. We will now choose a $t$, say $t_1$ to send to $t_1^1 = t_1$ and fix all other $t$'s. Similarly the second mapping sends $t_1 \rightarrow t_1^2$.

So we have two automorphisms. Next we will take these two mappings and for each we will send $t_2 \rightarrow t_2^2$ while keeping everything else fixed. This will give us two more automorphisms. At this point we have a total of four automorphisms. Then for the four automorphisms we send $t_3 \rightarrow t_3^2$, which brings us to eight automorphisms. To complete the group $M$ we will take all eight mappings and will permutate $t_1 \rightarrow t_2$ and $t_2 \rightarrow t_1$, $(1,2)$. Similarly we will also perform the following permutations,

$$
\begin{align*}
 t_1 & \rightarrow t_3, \ (1,3) \\
 t_2 & \rightarrow t_3, \ (2,3) \\
 t_1 & \rightarrow t_2 \rightarrow t_3, \ (1,2,3) \\
 \text{and} \ t_1 & \rightarrow t_3 \rightarrow t_2, \ (1,3,2).
\end{align*}
$$

The first two automorphisms we found represent the group $U_1(3)$ which is of order 2. Then we found the next two sets of automorphisms that represent groups $U_2(3)$ and $U_3(3)$. When permutate the set of $t$’s the set of permutations is $S_3$. Applying the permutations to our previous mappings of $U_1(3)$, $U_2(3)$, and $U_3(3)$ we find the last set of automorphisms, multiplying the eight automorphisms by six, which completes our group $M$, bringing the order of $M$ to 48, $(2 \times 2 \times 2 \times 6)$. When we find the isomorphism type of $M$ we see that it is the wreath product $U(3) \wr S_3$.

Chapter 6

More Monomial Progenitors

6.1 Preliminaries

Definition 6.1 (Representation of G). Let G be a finite group. A representation of G is a homomorphism \( \phi : G \to \text{GL}(n, F) \), where \( \text{GL}(n, F) \) is the group of \( n \times n \) invertible matrices over a finite field F.

Definition 6.2 (Character). The character \( \chi \) afforded by the representation \( \rho : G \to \text{GL}(n, F) \) is a function,

\[
\chi : G \to F, \text{ given by } \chi(g) = \text{Tr}(g\rho) \forall g \in G.
\]

Definition 6.3 (Character Table). Consider the character table as the matrix \( \left( \chi^{(i)}_{\alpha} \right) \).

In a character table, let \( \chi \) be the row vector \( h_{\alpha} \chi^{(i)}_{\alpha} \).

1. Let \( \overline{Y} \) be the conjugate of the row vector \( \left( \chi^{(i)}_{\alpha} \right) \). If \( i \neq j \), then the ordinary dot product

\[
X \cdot \overline{Y} = 0.
\]

2. Then the ordinary dot product

\[
X \cdot \left( \chi^{(i)}_{\alpha} \right) = |G|.
\]

Definition 6.4 (Monomial Matrix). A monomial matrix is an \( n \times n \) matrix that has exactly one non-zero entry in each row and column.

Definition 6.5 (Monomial Representation of G). For a group G, a monomial representation is a representation \( A : G \to \text{GL}(n, \mathcal{U}) \), provided that \( A(x) \) and \( A(y) \) are monomial matrices.
Definition 6.6 (Monomial Character of $G$). If a character $\phi$ of $G$ is induced by a linear character of a subgroup $H$ of $G$ then $\phi$ is a monomial character.

Definition 6.7 (Induced Character). Let $\Phi(u)$ be a character of $H$ and $\phi(x) = 0$ if $x \notin H$. Then

$$
\phi^G(x) = \begin{cases} 
\phi(x) & \text{if } x \in H \\
0 & \text{if } x \notin H
\end{cases}
$$

is an induced character of $G$.

6.2 Monomial Progenitor $3^3 : S_4$

We will first explain how we write a monomial progenitor using an example, $3^3 : S_4$, and then we will give images of a monomial progenitor that we have written, $3^3 : m L_2(3)$.

As an example we will write a monomial progenitor $3^3 : m S_4$ using MAGMA. We first begin by noting a presentation for $S_4$ is

$$< x, y | x^4, y^2, (x * y)^3 >.$$

We will induce a linear character of the subgroup $H$ of $G$. We may choose any subgroup of $S_4$, whose index is equal to the degree of an irreducible character of $G$. To find a suitable subgroup we use the following code in MAGMA.

```plaintext
> Cr:=CharacterTable(G);
> for i in [1..#Cr] do i,Cr[i][1];
for> end for;
1 1
2 1
3 2
4 3
5 3
> S:=Subgroups(G);
> #S;
11
> for i in [1..#S] do i, Index(G,S[i]\text{`subgroup});
for> end for;
1 24
2 12
```
From above we see that $S[9]$ has index 3 and the degrees of $Cr[4]$ and $Cr[5]$ are also 3. This means that we will induce a linear character of $H = S[9]$ of $G$ and our index of $A(x)$ and $A(y)$ will also be 3, that is, $A(x)$ and $A(y)$ will be represented by $3 \times 3$ matrices. The Character Tables of $G$ and $H$ are given below.

### Table 6.1: Character Table of $A_4$

<table>
<thead>
<tr>
<th>$\chi$</th>
<th>$C_1$</th>
<th>$C_2$</th>
<th>$C_3$</th>
<th>$C_4$</th>
<th>$C_5$</th>
</tr>
</thead>
<tbody>
<tr>

<td>1</td>
</tr>
<tr>
<td>$\chi_5$</td>
<td>2</td>
<td>-2</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

We induce from the second character, $\chi_2$. We can now find $A(x)$ and $A(y)$.

$$A(x) = \begin{pmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & -1 \end{pmatrix}$$
Each column represents \( t_1, t_2, t_3 \) respectively. The elements of \( S_4 \) act as automorphisms of \( \langle t_1 \rangle \ast \langle t_2 \rangle \ast \langle t_3 \rangle \). Therefore, \( a_{ij} = 1 \) if the automorphism takes \( t_i \to t_j \) and \( a_{ij} = n \) if the automorphism takes \( t_i \to t_j^n \). By translating the matrices of \( A(x) \) and \( A(y) \), we will be able to represent \( x \) and \( y \) as permutations.

Table 6.3: Automorphisms of \( A(x) \)

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>( t_1 )</td>
<td>( t_2 )</td>
<td>( t_3 )</td>
<td>( t_1^{-1} )</td>
<td>( t_2^{-1} )</td>
<td>( t_3^{-1} )</td>
</tr>
<tr>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
</tr>
<tr>

<td>( t_1^{-1} )</td>
<td>( t_3^{-1} )</td>
<td>( t_2^{-1} )</td>
<td>( t_1 )</td>
<td>( t_3 )</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
<td>6</td>
<td>5</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

Table 6.4: Automorphisms of \( A(y) \)

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>( t_1 )</td>
<td>( t_2 )</td>
<td>( t_3 )</td>
<td>( t_1^{-1} )</td>
<td>( t_2^{-1} )</td>
<td>( t_3^{-1} )</td>
</tr>
<tr>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
</tr>
<tr>
<td>( t_1 )</td>
<td>( t_3 )</td>
<td>( t_2 )</td>
<td>( t_1^{-1} )</td>
<td>( t_3^{-1} )</td>
<td>( t_2^{-1} )</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>2</td>
<td>4</td>
<td>6</td>
<td>5</td>
</tr>
</tbody>
</table>

From the tables above we get the following permutations for \( x \) and \( y \).

\[
x = (1, 2, 4, 5)(3, 6)
\]

\[
y = (2, 3)(5, 6)
\]

Now we will label our \( t \sim t_1 \). We need to find the permutations of \( S_4 \) that normalize \( \langle t_1 \rangle \). The normalizer of \( \langle t_1 \rangle \) in \( S_4 \) is generated by 3 elements, \((2,3)(5,6)\), \((2,6)(3,5)\), \((1,4)(2,5)\). Using the Schreier System we find that

\[
(2,3)(5,6) = y
\]

\[
(2,6)(3,5) = x^2yx^2
\]

\[
(1,4)(2,5) = x^2.
\]

The first two elements fix \( t_1 \), which means we will add them into the progenitor by writing them as the following.
\[(t, y)\]
\[(t, x^2yx^2)\]

The last element sends \(1 \to 4\), therefore mapping \(t_1 \to t_1^{-1}\). So we write it as
\[t^2 = t^{-1}.\]

Now we can write a presentation for the monomial progenitor.

\[3^{*3} :_m S_4 = \langle x, y, t | x^4, y^2, (xy)^3, t^3, (t, y), (t, x^2yx^2), t^2 = t^{-1} \rangle\]

### 6.3 Monomial Progenitor \(3^{*3} :_m L_2(3)\)

We will write a monomial progenitor \(3^{*3} :_m L_2(3)\) using MAGMA. We first begin by noting a presentation for \(L_2(3)\) is
\[\langle x, y | x^3, y^2, (x \cdot y)^3 \rangle.\]

We will induce a linear character of the subgroup \(H\) of \(G\). We may choose any subgroup of \(L_2(3)\), whose index is equal to the degree of an irreducible character of \(G\). To find a suitable subgroup we use the following code in MAGMA.

```magma
> Cr:=CharacterTable(G);
> for i in [1..#Cr] do i,Cr[i][1];
for> end for;
1 1
2 1
3 1
4 3
> S:=Subgroups(G);
> #S;
5
> for i in [1..#S] do i, Index(G,S[i]`subgroup);
for> end for;
1 12
2 6
3 4
4 3
5 1
```
From above we see that $S[4]$ has index 3 and the degrees of $Cr[4]$ is also 3. This means that we will induce a linear character of $H = S[4]$ of $G$ and our index of $A(x)$ and $A(y)$ will also be 3, that is, $A(x)$ and $A(y)$ will be represented by $3 \times 3$ matrices. The Character Tables of $G$ and $H$ are given below.

<table>
<thead>
<tr>
<th>Table 6.5: Character Table of $L_2(3)$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\chi$</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>$\chi_1$</td>
</tr>
<tr>
<td>$\chi_2$</td>
</tr>
<tr>
<td>$\chi_3$</td>
</tr>
<tr>
<td>$\chi_4$</td>
</tr>
</tbody>
</table>

$J$ is root of unity 3

<table>
<thead>
<tr>
<th>Table 6.6: Character Table of $H$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\chi$</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>$\chi_1$</td>
</tr>
<tr>
<td>$\chi_2$</td>
</tr>
<tr>
<td>$\chi_3$</td>
</tr>
<tr>
<td>$\chi_4$</td>
</tr>
</tbody>
</table>

We induce from the second character, $\chi_2$. We can now find $A(x)$ and $A(y)$.

$$A(x) = \begin{pmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{pmatrix}$$

$$A(y) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & -1 \end{pmatrix}$$

Each column represents $t_1, t_2, t_3$ respectively. The elements of $S_4$ act as automorphisms of $<t_1 > * <t_2 > * <t_3 >$. Therefore, $a_{ij} = 1$ if the automorphism takes $t_i \rightarrow t_j$ and $a_{ij} = n$ if the automorphism takes $t_i \rightarrow t_j^n$. By translating the matrices of $A(x)$ and $A(y)$, we will be able to represent $x$ and $y$ as permutations.

From the tables above we get the following permutations for $x$ and $y$.

$$x = (1, 2, 3)(4, 5, 6)$$
$$y = (2, 5)(3, 6)$$
Table 6.7: Automorphisms of $A(x)$

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>$t_1$</td>
<td>$t_2$</td>
<td>$t_3$</td>
<td>$t_1^{-1}$</td>
<td>$t_2^{-1}$</td>
<td>$t_3^{-1}$</td>
<td></td>
</tr>
<tr>
<td>$t_1$</td>
<td>$t_2$</td>
<td>$t_3$</td>
<td>$t_1^{-1}$</td>
<td>$t_2^{-1}$</td>
<td>$t_3^{-1}$</td>
<td></td>
</tr>
</tbody>
</table>

Table 6.8: Automorphisms of $A(y)$

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
<tbody>
<tr>
<td>$t_1$</td>
<td>$t_2$</td>
<td>$t_3$</td>
<td>$t_1^{-1}$</td>
<td>$t_2^{-1}$</td>
<td>$t_3^{-1}$</td>
<td></td>
</tr>
<tr>
<td>$t_1$</td>
<td>$t_2^{-1}$</td>
<td>$t_3^{-1}$</td>
<td>$t_2$</td>
<td>$t_3$</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Now we will label our $t \sim t_1$. We need to find the permutations of $S_4$ that normalize $<t_1>$. The normalizer of $<t_1>$ in $S_4$ is generated by 2 elements, $(2,5)(3,6)$ and $(1,4)(2,5)$. Using the Schreier System we find that

$$(2, 5)(3, 6) = y$$

$$(1, 4)(2, 5) = xyx^{-1}.$$ 

The first element fixes $t_1$, which means we will add it into the progenitor by writing it as the following.

$$(t, y)$$

The second element sends $1 \rightarrow 4$, therefore mapping $t_1 \rightarrow t_1^{-1}$. So we write as

$$t^{xyx^{-1}} = t^{-1}.$$ 

Now we can write a presentation for the monomial progenitor.

$$3^* : m L_2(3) =< x, y, t | x^3, y^2, (xy)^3, t^3, (t, y), t^{xyx^{-1}} = t^{-1} >$$

By adding the following relations to the progenitor we get the images given below.

$$(y \ast (t^y)^x \ast t \ast t^x)^a, (t^y \ast x \ast y \ast t)^b, (x \ast t \ast t^x)^c, (t \ast t^x \ast t^y \ast x)^d, (x \ast t)^e$$

Chapter 7

Transitive Progenitors

When writing progenitors of the form $m^n : N$, we require that $N$ be transitive. MAGMA allows us to find proper transitive groups on $n$ letters by using the command `TransitiveGroups(n,i)`. Then we find the presentation for the group by using the command `SmallGroupDatabase()` which allows us to write the progenitor.

7.1 Transitive Group on 8 Letters

We will write a progenitor from a transitive group on 8 letters using MAGMA. There exist 50 transitive groups on 8 letters. The transitive group we chose was

\[ N := \text{TransitiveGroup}(8,19); \]

which has order 32. We can identify and find the presentation of $N$ using the following commands

\[ \text{IdentifyGroup}(N); \]
\[ D := \text{SmallGroupDatabase}(); \]
\[ G := \text{SmallGroup}(D, 32, 6); \]

where $G$ is the new name in MAGMA for $N$. The command

\[ \text{FPGroup}(G); \]

gives us a presentation of the group that allows us to form the progenitor.

We find that $G$ has the following presentation with 5 generators.
This is the presentation of \( N \) for the progenitor \( 2^8 : N \). Our presentation is on 32 letters because the order of \( N \) is 32 but this can be written on 8 letters. We need to find the subgroups of \( G \) in order to find a faithful permutation representation of \( N \) on 8 letters.

\[
\begin{align*}
G &= \langle a, b, c, d, e \mid a^2 = d, b^2, c^2, d^2, e^2, b^a &= b * c, c^a &= c * e, c^b &= c, d^a &= d, d^b &= d * e, \\
& \quad d^c = d, e^a = e, e^b = e, e^c = e, e^d = e \rangle
\end{align*}
\]

\[f, G_1, k := \text{CosetAction}(G, \langle a, b, c, d, e \rangle) ;\]
\[\#G_1 ;\]
\[32\]

\[\text{SL := Subgroups}(G_1) ;\]
\[\text{T := \{X\text{'s subgroup: X in SL}\}} ;\]
\[\#T ;\]

\( T \) stores all the subgroups of \( G \), and we will call each subgroup \( H \). The command \( \text{Core}(G_1, H) \) tells us the kernel of the subgroups, and we are interested in subgroups with kernel equal to 1. So we then run the following command.

\[\text{TrivCore := \{H:H in T| \#Core}(G_1, H) \text{ eq 1}\}} ;\]

From this we see that we have 9 subgroups whose kernel equals 1. Of those subgroups we now want the subgroup of smallest degree, 8.

\[\text{Good := \{H: H in TrivCore| Index}(G_1, H) \text{ eq mdeg}\}} ;\]

Now we choose a representative from those subgroups of smallest degree.

\[H := \text{Rep}(\text{Good}) ;\]

And so now we can see that \( G_1 \) is on 8 letters.

\[f, G_1, K := \text{CosetAction}(G_1, H) ;\]
\[G_1 ;\]
\[\text{Permutation group G1 acting on a set of cardinality 8}\]
\[\text{Order = 32 = 2^5}\]
\[(2, 5, 6, 8)(3, 7)\]
\[(1, 2)(3, 5)(4, 6)(7, 8)\]
\[(1, 3)(2, 5)(4, 7)(6, 8)\]
\[(2, 6)(5, 8)\]
\[(1, 4)(2, 6)(3, 7)(5, 8)\]
Now we introduce a new variable, $t$ and let $t t_1$ and we find the stabilizer to complete the progenitor. We find that $a$ and $d$ commute with $t$. Our complete progenitor is the following.

$$2^8 : N = \langle a, b, c, d, e, t | a^2 = d, b^2, c^2, d^2, e^2, b^6 = b \ast c, c^a = c \ast e, e^b = c, d^a = d, d^b = d \ast e,$$

$$d^c = d, e^a = e, e^b = e, e^c = e, e^d = e, t^2, (t, a), (t, d) \rangle$$

By adding the following relations to the progenitor we get the images given below.

$$(c \ast t^b)^i, (b \ast c \ast t \ast t^b)^j, (c \ast e \ast t \ast t^b)^k, (b \ast c \ast e \ast t^b \ast t^c \ast t^e)^l, (b \ast c \ast e \ast t^b \ast t^c \ast t)^m$$
