The main objective of this project is to find the original symmetric presentations of some very important finite groups and to give our constructions of some of these groups. We have found the Mathieu sporadic group $M_{11}$, $HS \times D_5$, where HS is the sporadic group Higman-Sim group, the projective special unitary group $U(3,5)$ and the projective special linear group $L_2(149)$ as homomorphic images of the monomial progenitors $11^4 : m (5 : 4), 5^6 : m S_5$ and $149^2 : m D_{37}$. We have also discovered $2^4 : S_3 \times C_2$, $2^4 : A_5$, $(2^5 : S_4)$, $2^5 : S_3 \times S_3$, $3^3 : S_4 \times C_2$, $S_6$, $2^9 : PGL(2,7)$, $2^2 \bullet (S_6 : S_6)$, $PGL(2,19)$, $((A_5 : A_5 \times A_5) : D_6)$, $6 \bullet (U_4(3) : 2)$, $2 \bullet PGL(2,13)$, $S_7$, $PGL(2,8)$, $PSL(2,19)$, $2 \times PGL(2,81)$, $2^5 : (S_6 \times A_5)$, $2^6 : S_4 \times D_3$, $U(4,3)$, $3^4 : S_4$, $3^2 : D_6$, $2 \bullet (PGL(2,7) : PSL(2,7))$, $2^2 : (S_5 : S_5)$ and $2^3 : (PSL_3(4) : 2)$ as homomorphic images of the permutation progenitors $2^{48} : (2 \times 4 : 2)$, $2^{16} : (2 \times 4 : C_2 \times C_2)$, $2^9 : (S_3 \times S_3)$, $2^9 : (S_3 \times A_3)$, $2^9 : (3^2 : 2^3)$ and $2^9 : (3^3 : A_3)$. We have also constructed $2^4 : S_3 \times C_2$, $2^4 : A_5$, $(2^5 : S_4)$, $2^5 : S_3 \times S_3$, $3^3 : S_4 \times C_2$, $S_6$, $M_{11}$ and $U (3,5)$ by using the technique of double coset enumeration. We have determined the isomorphism types of the most of the images mentioned in this thesis. We demonstrate our work for the following examples: $3^4 : (3^2 \ast 2^3) \times 2$, $2^9 : PGL(2,7)$, $2 \bullet S_6$, $(5^4 : (D_4 \times S_3))$, and $3 : \bullet PSL(2,19) \times 2$. 
Acknowledgements

I would like to thank everyone for their assistance and for helping me through this journey and all that I have achieved. Particularly, I would like to say thank you to my wonderful professor, Dr. Zahid Hassan. I am grateful Dr. Zahid Hassan for your great support, motivation, and for guiding me through my research. I would also like to thank Dr. Corey Dunn and Dr. J. Paul Vicknair for being part of my thesis committee. I would not forget to thank and appreciate all my classmates, Shirley Juan, Diana Aguirre, Joana, and Angelica for lending me a helping hand. To my husband, Maher, I am truly grateful for your endless support as well. I appreciate you for the encouragement and for seeing me through my Master’s degree. On the same note, I thank Ryan, my son, for being there and for making studying more fun. I would also like to thank my parent and siblings for motivating, inspiring, being there for me. I appreciate your support and love. Finally, I thank my country, Saudi Arabia, for giving me the opportunity to come to the United States to finish my study.

Introduction

Group theory is the significant topic in mathematics and abstract algebra. Group theory allows to study the algebraic structures known as group. In this thesis, we show symmetric presentations of finite groups. Also, we are interested to show some of groups which we could get them from our progenitors through our research for example Mathieu groups, alternating groups, linear groups, symmetric groups and Unitary groups. We show shortly in the following some of the concepts which we will discuss them in this thesis. In chapter 1, we give some important definitions and theorem which are used in this thesis. In chapter 2, we provide some of relations lemma which help us to find relations to factor our progenitors $m^n : N$ by them. Thus, we apply the factoring lemma, the famous lemma, or the first order relation lemma to factor our progenitors. In chapter 3, we describe character table construction. So, we build table of $D_4$, and we will induce a linear character of a proper subgroups. In chapter 4, we will see how we can compute an extension problem to find isomorphic type of our group by looking to the composition factor of group. In chapter 5, we will show progenitors and their homomorphic images. In chapter 6, we give transitive group on 9 letters with some of their homomorphic images. In chapter 7, we clarify how we can induce and verify a linear character of the monomial progenitors. Also, we verify the monomial representation and construct a permutation representation by hand. Moreover, we find a representation of the monomial progenitor. In chapter 8, we will demonstrate the technique of double coset enumeration and we will construct Caylay diagram of double coset enumeration. In chapter 9, we apply the technique of double coset enumeration over maximal subgroup. So, we will show double coset enumeration of $M_{11}$ over maximal subgroup $S_5$ and double coset enumeration of $U(3, 5)$ over maximal subgroup $A_7$. 
Chapter 1

Group Theory Preliminaries

1.1 Definitions

Definition 1.1. A group \( G = (G, \ast) \) is a nonempty collection of elements with an associative operation \( \ast \), such that:

- there exists an identity element, \( e \in G \) such that \( e \ast a = a \ast e \) for all \( a \in G \);
- for every \( a \in G \), there exists an element \( b \in G \) such that \( a \ast b = e = b \ast a \). [Rot95]

Definition 1.2. For group \( G \), a subgroup \( S \) of \( G \) is a nonempty subset where \( s \in G \) implies \( s^{-1} \in G \) and \( s, t \in G \) imply \( st \in G \). We denote subgroup \( S \) of \( G \) as \( S \leq G \). [Rot95]

Definition 1.3. Let \( H \) be a subgroup of group \( G \). \( H \) is a proper subgroup of \( G \) if \( H \neq G \). We denote this as \( H < G \). [Rot95]

Definition 1.4. Let \( G \) be a group and \( H \leq G \). \( H \) is a maximal subgroup of \( G \) if there is no normal subgroup \( N \leq G \) such that \( H < N < G \). [Rot95]

Definition 1.5. A symmetric group, \( S_X \), is the group of all permutations of \( X \), where \( X \in \mathbb{N} \). \( S_X \) is a group under compositions. [Rot95]

Definition 1.6. If \( X \) is a nonempty set, a permutation of \( X \) is a bijection \( \phi : X \rightarrow X \). [Rot95]
Definition 1.7. If $x \in X$ and $\phi \in S_X$, then $\phi$ fixes $x$ if $\phi(x) = x$ and $\phi$ moves $x$ if $\phi(x) \neq x$. [Rot95]

Definition 1.8. For permutations $\alpha, \beta \in S_X$, $\alpha$ and $\beta$ are disjoint if every element moved by one permutation is fixed by the other. Precisely, if $\alpha(x) \neq x$, then $\beta(a) = a$ and if $\alpha(y) = y$, then $\beta(y) \neq y$. [Rot95]

Definition 1.9. A permutation which interchanges a pair of elements is a transposition. [Rot95]

Definition 1.10. In group $G$, if $a, b \in G$, $a$ and $b$ commute if $a \ast b = b \ast a$. [Rot95]

Definition 1.11. A group $G$ is abelian if every pair of elements in $G$ commutes with one another. [Rot95]

Definition 1.12. Let $G$ be a group. The order of $G$ is the number of elements contained in $G$. We denote the order of $G$ by $|G|$. [Rot95]

Definition 1.13. Let $G$ be a group. $G$ is simple if the only normal subgroups of $G$ are 1 and $G$. [Rot95]

Definition 1.14. Let $p$ be prime. If $G \cong \mathbb{Z}_p \times \mathbb{Z}_p \times \cdots \times \mathbb{Z}_p$, then we say $G$ is elementary abelian. [Rot95]

Definition 1.15. Let $(G, \ast)$ and $(H, \circ)$ be groups. The function $\phi : G \to H$ is a homomorphism if $\phi(a \ast b) = \phi(a) \circ \phi(b)$, for all $a, b \in G$. An isomorphism is a bijective homomorphism. We say $G$ is isomorphic to $H$, $G \cong H$, if there exists an isomorphism $f : G \to H$. [Rot95]

Definition 1.16. Let $f : G \to H$ be a homomorphism. The kernel of a homomorphism is the set $\{x \in G | f(x) = 1\}$, where 1 is the identity in $H$. We denote the kernel of $f$ as $\ker f$. [Rot95]

Definition 1.17. Let $X$ be a nonempty subset of a group $G$. Let $w \in G$ where $w = x_1^{e_1} x_2^{e_2} \cdots x_n^{e_n}$, with $x_i \in X$ and $e_i = \pm 1$. We say that $w$ is a word on $X$. [Rot95]

Definition 1.18. Let $G$ be a group such that $K \leq G$. $K$ is normal in $G$ if $gKg^{-1} = K$, for every $g \in G$. We will use $K \triangleleft G$ to denote $K$ as being normal in $G$. [Rot95]
**Definition 1.19.** Let $a, b \in G$. We denote the **commutator** of $a$ and $b$ by $[a, b]$, where $[a, b] = aba^{-1}b^{-1}$. [Rot95]

**Definition 1.20.** Let $G$ be a group. The **Derived Group** of $G$, denoted $G'$, is the subgroup of $G$ formed by all the commutators of $G$. [Rot95]

**Definition 1.21.** Let $G$ be a group. The **index** of $H \leq G$, denoted $[G : H]$, is the number of right cosets of $H$ in $G$. [Rot95]

**Definition 1.22.** Let $X$ be a set and $G$ be a group. We say $X$ is a **$G$-set** if there exists a function $\phi : G \times X \to X$ (which we call an **action**) and the following hold for $\phi$:

- $1x = x$, for all $x \in X$.
- $g(hx) = (gh)x$, for $g, h \in G$ and $x \in X$. [Rot95]

**Definition 1.23.** Let $G$ be a group. The **center** of $G$, $Z(G)$, is the set of all elements in $G$ that commute with all elements of $G$. [Rot95]

**Definition 1.24.** Let $G$ be a group. If $H \leq G$, the **normalizer** of $H$ in $G$ is defined by $N_G(H) = \{a \in G|aHa^{-1} = H\}$. [Rot95]

**Definition 1.25.** Let $G$ be a group. If $H \leq G$, the **centralizer** of $H$ in $G$ is:

$$C_G(H) = \{x \in G : [x, h] = 1 \text{ for all } h \in H\}. \ [Rot95]$$

**Definition 1.26.** Let $G$ be a group and $X$ be a $G$-set. For $x \in X$, the set $x^G = \{x^g|g \in G\}$ is a **$G$-Orbit**. [Rot95]

**Definition 1.27.** Let $X$ be a $G$-set. Let $\alpha$ be an action of $G$ on $X$. If $\tilde{\alpha} : G \to S_X$ is injective, we say $X$ is **faithful**. [Rot95]

**Definition 1.28.** Let $G$ be a group and $X$ be a $G$-set. $X$ is **transitive** if for all $x, y \in X$ there exists a $g \in G$ such that $y = gx$. [Rot95]

**Definition 1.29.** Let $G$ be a group. A **normal series** $G$ is a sequence of subgroups

$$G = G_0 \geq G_1 \geq \cdots \geq G_n = 1$$

with $G_{i+1} \triangleleft G_i$. Furthermore, the **factor groups** of $G$ are given by $G_i/G_{i+1}$ for $i = 0, 1, \ldots, n - 1$. [Rot95]
Definition 1.30. Let $X$ be a set and $\Delta$ by a family of words on $X$. A group $G$ has generators $X$ and relations $\Delta$ if $G \cong F/R$, where $F$ is a free group with basis $X$ and $R$ is the normal subgroup of $F$ generated by $\Delta$. We say $<X|\Delta>$ is a presentation of $G$. [Rot95]

Definition 1.31. Let $X$ be a $G$-set. Then for $B \subseteq X$, $B$ is a block if for every $g \in G$, either $gB = B$ or $gB \cap B = \emptyset$. [Rot95]

Definition 1.32. Let $X$ and $Y$ be $G$-sets. The function $f : X \to Y$ is a $G$-map if $f(gx) = gf(x)$, for all $x \in X$ and $g \in G$. [Rot95]

Definition 1.33. Let $X$ be a $G$-set. $X$ is primitive if $X$ has no nontrivial blocks. If $X$ is primitive, the only blocks of $X$ are $B = X$ and $B = \emptyset$. [Rot95]

1.2 Theorems

Theorem 1.34. Every permutation $\alpha \in S_n$ is either a cycle or a product of disjoint cycles. [Rot95]

Theorem 1.35. Let $f : (G, \ast) \to (G', \circ)$ be a homomorphism. The following hold true:

- $f(e) = e'$, where $e'$ is the identity in $G'$,
- If $a \in G$, then $f(a^{-1}) = f(a)^{-1}$,
- If $a \in G$ and $n \in \mathbb{Z}$, then $f(a^n) = f(a)^n$. [Rot95]

Theorem 1.36. The intersection of any family of subgroups of a group $G$ is again a subgroup of $G$. [Rot95]

Theorem 1.37. If $S \leq G$, then any two right (or left) cosets of $S$ in $G$ are either identical or disjoint. [Rot95]

Theorem 1.38. If $G$ is a finite group and $H \leq G$, then $|H|$ divides $|G|$ and $|G : H| = |G|/|H|$. [Rot95]

Theorem 1.39. If $S$ and $T$ are subgroups of a finite group $G$, then

$$|ST||S \cap T| = |S||T|.$$ [Rot95]
Theorem 1.40. If \( N \triangleleft G \), then the cosets of \( N \) in \( G \) form a group, denoted by \( G/N \), of order \( [G : N] \). [Rot95]

Theorem 1.41. The commutator subgroup \( G' \) is a normal subgroup of \( G \). Moreover, if \( H \triangleleft G \), then \( G/H \) is abelian if and only if \( G' \leq H \). [Rot95]

Theorem 1.42. Let \( \phi : G \to H \) be a homomorphism with kernel \( K \). Then \( K \) is a normal subgroup of \( G \) and \( G/K \cong \ker \phi \). [Rot95]

Theorem 1.43. Let \( N \) and \( T \) be subgroups of \( G \) with \( N \) normal. Then \( N \cap T \) is normal in \( T \) and \( T/(N \cap T) \cong NT/N \). [Rot95]

Theorem 1.44. Let \( G \) be a group with normal subgroups \( H \) and \( K \). If \( HK = G \) and \( H \cap K = 1 \), then \( G \cong H \times K \). [Rot95]

Theorem 1.45. If \( a \in G \), the number of conjugates of \( a \) is equal to the index of its centralizer:

\[
|a^G| = [G : C_G(a)],
\]

and this number is a divisor of \( |G| \) when \( G \) is finite. [Rot95]

Theorem 1.46. If \( H \leq G \), then the number \( c \) of conjugates of \( H \) in \( G \) is equal to the index of its normalizer: \( c = [G : N_G(H)] \), and \( c \) divides \( |G| \) when \( G \) is finite. Moreover, \( aHa^{-1} = bHb^{-1} \) if and only if \( b^{-1}a \in N_G(H) \). [Rot95]

Theorem 1.47. If \( H \leq G \) and \( [G : H] = n \), then there is a homomorphism \( \rho : G \to S_n \) with \( \ker \rho \leq H \). The homomorphism \( \rho \) is called the representation of \( G \) on the cosets of \( H \). [Rot95]

Theorem 1.48. If \( X \) is a \( G \)-set with action \( \alpha \), then there is a homomorphism \( \bar{\alpha} : S_X \) given by \( \bar{\alpha} : x \mapsto gx = \alpha(g,x) \). Conversely, every homomorphism \( \varphi : G \to S_X \) defines an action, namely, \( gx = \varphi(g)x \), which makes \( X \) into a \( G \)-set. [Rot95]

Theorem 1.49. Every two composition series of a group \( G \) are equivalent. We will refer to this Theorem as the Jordan-Hölder Theorem. [Rot95]

Theorem 1.50. Let \( X \) be a faithful primitive \( G \)-set of degree \( n \geq 2 \). If \( H \triangleleft G \) and if \( H \neq 1 \), then \( X \) is a transitive \( H \)-set. Also, \( n \) divides \( |H| \). [Rot95]
Chapter 2

Writing Relations

Now we give important lemmas which assist us to find appropriate relations to factor our progenitors.

2.1 The Factoring Lemma

Factoring the progenitor $m^n : N$ by $(t_i, t_j)$ for $1 \leq i \leq j \leq n$ gives the group $m^n : N$. [Gri15]

This factoring lemma is used to check if the progenitor was written correctly or not.

2.1.1 Factoring Lemma Preformed on the Progenitor $11^{*2} : D_5$

Consider the progenitor $11^{*2} : D_5$. Now, if we factor the progenitor $11^{*2} : D_5$ by the relation $t_1 t_2 = t_2 t_1$, we must get $|11^{*2} : D_5| = 112 \times 10 = 1210$. Where $t_1 \sim t$ and $t_2 \sim t^9$, the progenitor must generate our group $11^{*2} : D_5$. We will show this by using MAGMA.

```magma
S:=Sym(20);
xx:=S!(1,9,5,7,17)(2,18,8,6,10)(3,19,11,15,13)(4,14,16,12,20);
yy:=S!(1,2)(3,4)(5,6)(7,8)(9,10)(11,12)(13,14)(15,16)(17,18)(19,20);
Nm:=sub<S|xx,yy>;
#Nm;
10
FPGroup(Nm);
```
Finitely presented group on 2 generators

Therefore, our progenitor is written correctly.
2.2 The Famous Lemma

Theorem 2.1. (Famous Lemma). \(N \cap \langle t_i, t_j \rangle \leq C_N(N_{ij})\), where \(N_{ij}\) denotes the stabilizer in \(N\) of the two points \(i\) and \(j\). [Cur07]

2.2.1 The Famous Lemma Performed on the Progenitor \(2^*8 : (2 \times 4 : 2)\)

We have given another way to produce important relations by a lemma is called the famous lemma. Through the following example, we will describe steps to apply the famous lemma. First, we need to store these generators of the permutation group \(N = \langle ww, xx, yy, zz \rangle\) in Magma. We will look for the highest digit in the permutations. Since 8 is the highest number, we will use sym(8).

\[
S := \text{Sym}(8);
ww := S!(2, 5)(3, 7);
xx := S!(1, 2)(3, 6)(4, 5)(7, 8);
yy := S!(1, 3, 4, 7)(2, 6, 5, 8);
zz := S!(1, 4)(2, 5)(3, 7)(6, 8);
N := \text{sub}<S|ww, xx, yy, zz>
\]

We check the order of \(N\), so it is equal 16. Next, we want to ask Magma for a presentation for \(N\).

\[
\text{FPGroup}(N);
\]

Finitely presented group on 4 generators

Relations
\[
\$.1^2 = \text{Id}($)
\$.2^2 = \text{Id}($)
\$.3^4 = \text{Id}($)
\$.4^2 = \text{Id}($)
\$(.1 * .3^{-1})^2 = \text{Id}($)
\$.2 * .3^{-1} * .2 * .3 = \text{Id}($)
\$.3^{-2} * .4 = \text{Id}($)
\$.1 * .2 * .1 * .2 * .4 = \text{Id}($)
\]

This will be our presentation for \(N\), where .1 = \(w\), .2 = \(x\), .3 = \(y\), and .4 = \(z\) type in \(NN = \text{Group} < w, x, y, z| w^2, x^2, y^4, z^2, (w * y^{-1})^2, x * y^{-1} * x * y, y^{-2} * z, w * x * w * x * z >\). Now, let us check the order of \(NN\). This should be equal to the order of \(N\), which was 16.

\[
\#NN;
16
\]
We have 16, then we can move on to the next step. We now have a presentation for NN, now we will add a $t_i'$s and make them commute with the stabilizer.

\[ N_1 := \text{Stabiliser}(N,1); \]
\[ \text{Generators}(N1); \]
\[(2, 5)(3, 7)\]

So, we will need to add $(t, (25)(37))$ to our presentation which means that $t$ commutes with $(25)(37)$. Also, we know that $t$ is of order 2, since the progenitor given is $2^8$, so we will add $t^2$ to our presentation as well. To write $(25)(37)$ in the presentation, we need to convert it into terms of $w$, $x$, $y$, and $z$. So, we will add this to our presentation that $(t, w)$ since $(2, 5)(3, 7)$ is equal $w$. Therefore, our presentation will look like this so far $G = \text{Group} < w, x, y, z, t | w^2, x^2, y^4, z^2, (\text{w*y^{-1})^2, x*y^{-1}*x*y, y^{-2}*z, w*x*w*y^{-2}*z, w*x*w*z, t^2, (t, w)>}$ We will now factor this presentation by the famous lemma. Famous lemma states that relations will look like as follow:

\[(xt_i)^m = 1 \text{ where m is odd and x sends 1 to 2 and (t_i*t_j)^m = x} \text{ where m is even and x fixes 1 and 2.} \ [Cur07] \]

Now, we need to find the centralizer of the point stabilizer of 1,2.

\[ N_{12} := \text{Stabiliser}(N,[1,2]); \]
\[ \text{C} := \text{Centraliser}(N, N_{12}); \]
\[ \text{C}; \]

Permutation group N acting on a set of cardinality 8
Order = 16 = 2^4
\[(2, 5) (3, 7)\]
\[(1, 2) (3, 6) (4, 5) (7, 8)\]
\[(1, 3, 4, 7) (2, 6, 5, 8)\]
\[(1, 4) (2, 5) (3, 7) (6, 8)\]

We consider permutation $(2,5)(3,7)$. The lemma tells us that if 1 and 2 are fixed then we use the following relation $(t_i * t^2)^m = (t * t^x)^m = w$, where m is even. We also see that the permutation $(1, 2)(3, 6)(4, 5)(7, 8)$, so we have this relation

\[((1,2)(3,6)(4,5)(7,8)*t_1)^m = (xt)^k = 1 \text{ since 1 send to 2 and k is odd.} \]

Finally, we will add these relations to our presentation.

\[ \text{for k in [0..10] do for m in [0,1,3,5,7,9] do; G<w,x,y,z,t:=Group<w,x,y,z,t|w^2,x^2,y^4,z^2,(w*y^{-1})^2, x*y^{-1}*x*y^{-2}*z, w*x*w*x*z, t^2, (t, w), (t*x)^k=1, (t*t*x)^m=w>; if #G gt 16 then k,m,#G; end if; end for; end for; \]
2.3 The First Order Relation

A relation of the form \((x*t_i)^a\), where \(x \in N\), and \(t_i \in \{t_1, t_2, t_3, \ldots\}\) and \(a \geq 2\).

To apply the first order relation, we need to do these steps which are:

- We need to find a presentation of the progenitor \(G = m^n : N\).
- We need to find classes of \(N\) and factor our progenitor by these classes.
- We have to compute the centralizer of all classes and orbits of all classes. Then, we can develop the first order relation from those orbits. [Why06]

In the following example, we apply those steps to factor our progenitor by the first order relation to find the homomorphism images.

2.3.1 The Progenitor \(2^{16} : (2 \times C_2 \times C_2)\) Factored by the First Order Relation

Chapter 3

Character Table Construction

3.1 Definitions and Theorem

Definition 3.1. Let $\chi_1, \ldots, \chi_k$ be the irreducible characters and conjugacy classes of $G$ and let $g_1, \ldots, g_k$ be representatives of the conjugacy classes of $G$. The $k \times k$ matrix whose $ij$-entry is $\chi_i(g_j)$ (for all $i, j$ with $1 \leq i \leq k, 1 \leq j \leq k$) is called the character table of $G$.

Definition 3.2. The degree of a character $\chi$ is $\chi(1)$. Note that a character whose degree is 1 is called a linear character. [Led87]

Theorem 3.3. Let $G$ be a finite group having the distinct irreducible $\chi^1, \chi^2, \ldots, \chi^k$. Let $1 \leq i, j \leq k$. Then $\sum_{i=1}^{k} \chi_i^{(i)} \chi_j^{(i)} = \frac{|G|}{h} \delta_{\alpha \beta}$

- In a character table, the dot product of any column with conjugate of any other column is 0.
- In a character table, the dot product of the column $\alpha$ with its own conjugate is $\frac{|G|}{h \alpha^2}$. [GL93]

Definition 3.4. In a character table the sum of squares of the degrees of the distinct irreducible characters of $G$ is equal to $|G|$. The degree of a character $\chi$ is $\chi^{(1)}$. [GL93]

Definition 3.5. The number of irreducible character of $G$ is equal to the number of conjugacy classes of $G$. [Led87]
Definition 3.6. Character table of a cyclic group
Let $G$ be a cyclic group of order $n$. Then $G = \langle z \rangle$, and $|z| = n$. Let $\epsilon_r = e^{\frac{2\pi ir}{n}}$, where $r = 0, 1, 2, \ldots, n$, be the $n$th roots of unity. For any $z^s \in G$, $s = 0, 1, 2, \ldots, n$, the values of the $n$ irreducible characters $\chi^{(r)}$ are given by $\chi^{(r)}(z^s) = e^{\frac{2\pi ir s}{n}}$, where $r = 0, 1, 2, \ldots, n$.

[GL93]

Definition 3.7. Let $a \in G$, where $G$ is a group. The conjugacy class of $a$ is given by $a^G = \{a^g | g \in G\} = \{g^{-1}ag | g \in G\}$. [Rot95]

Definition 3.8. Character table of an abelian group: Let $G$ be a finite abelian group say $G = \langle z_1 \rangle \times \langle z_2 \rangle \times \ldots \times \langle z_m \rangle$, where each $z_\mu$ is order of order $n_\mu$, and $|G| = n_1 n_2 \ldots n_m$. Let $x = z_1^{a_1} z_2^{a_2} \ldots z_m^{a_m}$, where $0 \leq a_\mu \leq n_\mu$ be an arbitrary element of $G$. Now let, for each $\mu$, $\epsilon_\mu = e^{\frac{2\pi i a_\mu}{n_\mu}}$, where $r_\mu = 0, 1, 2, \ldots, n_\mu$, be the $n_\mu$th roots of unity. Then corresponding to each $m$-tuple $r = [r_1, r_2, \ldots, r_m]$, $\chi^{(r)}$ are given by $\chi^{(r)}(x) = e^{2\pi i \sum_{\mu=1}^{m} \frac{a_\mu r_\mu}{n_\mu}}$ is an irreducible character of $G$. [GL93]

Definition 3.9. Lifting process: Let $N$ be a normal subgroup of $G$ and suppose that $A_0(Nx)$ is a representation of degree $m$ of the group $G/N$. Then $A(x) = A_0(Nx)$ defines a representation of $G/N$ LIFTED from $G/N$. If $\phi_0(Nx)$ is the character of $A_0(Nx)$, then $\phi(x) = \phi_0(Nx)$ is the lifted character of $A(x)$. Also, if $u \in N$, then $A(u) = I_m, \phi(u) = m = \phi(1)$. The lifting process preserves irreducibility. [Led87]

Definition 3.10. The group from a character table of the finite group:
(a) All normal subgroups of a finite group $G$ can be obtained from its character table as follows:
i. ker $\chi^{(i)}$ is the union of conjugacy classes $C_\alpha$ for which $\chi^{(i)}_\alpha = \chi^{(i)}(1)$.
ii. a collection of conjugacy classes from a normal subgroup $\iff$ it is an intersection of kernels of its characters.
(b) $|G| = \text{the number of linear characters of } G$.
(c) $G$ is simple if the kernel of each character is 1.
(d) The center is cyclic if the table contains a faithful character. [Led87]

Theorem 3.11. Let $\chi_1, \ldots, \chi_k$ be the irreducible characters of $G$, and let $g_1, \ldots, g_k$ be representatives of the conjugacy classes of $G$. Then the following relations hold for any $r, s \in 1, \ldots, k$. 
(1) The row orthogonality relations:

\[ \sum_{i=1}^{k} \frac{\chi_r(g_i)\bar{\chi}_s(g_i)}{|C_G(g_i)|} = \delta_{rs}. \]

(2) The column orthogonality relations:

\[ \sum_{i=1}^{k} \chi_i(g_r)\bar{\chi}_i(g_s) = \delta_{rs}|C_G(g_i)|. \]

Definition 3.12. The inner product of characters of G, say \( \phi \) and \( \psi \) can be found as follows:

\[ \langle \phi, \psi \rangle = \frac{1}{|G|} h_{\alpha} \phi^\alpha \bar{\psi}^\alpha, \]

where \( h_{\alpha} \) is the number of elements in the class \( \alpha \), \( \phi^\alpha \) is the value of \( \phi \) in the class \( \alpha \), \( \psi^\alpha \) is the value of \( \psi \) in the class \( \alpha \). Also, note that \( \chi^\alpha \) is the value of \( \chi \) at class \( \alpha \). \[\text{Led87}\]

3.2 Building the Character Table of \( D_4 \)

In this example, we will show how we can use the lifting process to find the character table of the dihedral group \( D_4 \). In order to build character table of the dihedral group \( D_4 \) of order 8. We will use the conjugacy classes.\[\text{Has17}\]

Let \( G = D_4 = \{e, a, a^2, a^3 b, a^2 b, a^3 b, ab\} \)

Let \( a = (1, 2, 3, 4), b = (1, 4)(2, 3), a^2 = (1, 3)(2, 4), a^3 = (1, 4, 3, 2), ab = (1, 3), a^3 b = (2, 4), \) and \( a^2 b = (1, 2)(3, 4). \)

Conjugacy Classes of group G

Next, we will find a normal subgroup of $G$. Now $a^2$ lies in the center of $G$, as it commutes with every element of $D_4$. Therefore, $N = \{1, a^2\}$ the center of $D_4$. Thus, the conjugacy classes being $\{1, a^2\}, \{a, a^3\}, \{b, a^2b\}, \text{and} \{ab, a^3b\}$. As a result, $D_4$ has 5 irreducible representations and $N = \{1\} \cup \{a^2\}$ is normal in $D_4$. The quotient group $\frac{|D_4|}{|N|} = \frac{8}{2} = 4$ and it is isomorphic to $Z/2 \oplus Z/2$. The group $Z/2 \oplus Z/2$ has four classes $\{Id, a, b, ab\}$.

### Table 3.1: Character Table of $Z/2 \oplus Z/2$

</tr>
<tr>
<td>$\mathcal{X}^5$</td>
<td>$f^5$</td>
<td>$\alpha$</td>
<td>$\beta$</td>
<td>$\gamma$</td>
<td>$\delta$</td>
</tr>
</tbody>
</table>

We know that the trivial representation is a representation that takes every element in $D_4$ to the identity, so the first row will be the trivial character $\mathcal{X}^1$ which is the identity character.
1) First, we now lift $X^1$ to $D_4$:

- $X^1$ is identity character. So, the elements of the first row will be 1, 1, 1, 1, and 1.

2) Next, we lift $X^2$ to $D_4$:

- $X^2(e) = x.2(1,3)(2,4) = 1$.
- $X^2((1,3)(2,4)) = x.2(N(1,3)(2,4)) = 1$.
- $X^2((1,4)(2,3)) = x.2(N(1,4)(2,3)) = 1$.
- $X^2((2,4)) = x.2(N(2,4)) = 1$.
- $X^2((1,2,3,4)) = x.2(N(1,2,3,4)) = -1$.

Thus, the elements of the second row will be 1, 1, 1, 1, and 1.

3) Also, we lift $X^3$ to $D_4$:

- $X^3(e) = x.3(N(1,3)(2,4)) = 1$.
- $X^3((1,3)(2,4)) = x.3(N(1,3)(2,4)) = 1$.
- $X^3((1,4)(2,3)) = x.3(N(1,4)(2,3)) = 1$.
- $X^3((2,4)) = x.3(N(2,4)) = 1$.
- $X^3((1,2,3,4)) = x.3(N(1,2,3,4)) = -1$.

So, the elements of the third row will be 1, 1, 1, 1, and 1.

4) Finally, we lift $X^4$ to $D_4$:

- $X^4(e) = x.4(N(1,3)(2,4)) = 1$.
- $X^4((1,3)(2,4)) = x.4(N(1,3)(2,4)) = 1$.
- $X^4((1,4)(2,3)) = x.4(N(1,4)(2,3)) = 1$.
- $X^4((2,4)) = x.4(N(2,4)) = 1$.
- $X^4((1,2,3,4)) = x.4(N(1,2,3,4)) = 1$.

So, the elements of the fourth row will be 1, 1, 1, 1, and 1.

We could lift the four characters of $Z/2 \oplus Z/2$ to obtain four characters $X^1$, $X^2$, $X^3$, $X^4$ of $D_4$ it remains to find $X^5$. Then, we use the fact that the sum of squares of the degrees of the distinct irreducible characters of $G$ which is equal to $|D_4|$ to find the first element of $X^5$, it will be as follows:
\[(f_1)^2 + (f_2)^2 + (f_3)^2 + (f_4)^2 + (f_5)^2 = 1^2 + 1^2 + 1^2 + 1^2 + (f_5)^2 = |G| = 8. \] So, \( f_5 = 2. \)

For the moment denote the values of \( \chi_5 \) for \( C2, C3, C4, \) and \( C5 \) by \( \alpha, \beta, \gamma, \delta \) respectively. To find last row values we will use the orthogonality relations. By theorem, in a character table, the dot product of any column with the conjugate of any other column is 0.

**The column 1 and column 2 of character table of \( D_4 \):**
- \((1). (\bar{1}) + (1). (\bar{1}) + (1). (\bar{1}) + (1). (\bar{1}) + (2). (\bar{\alpha}) = 0 \implies \bar{\alpha} = \frac{-4}{2} = -2. \) Thus, \( \alpha = -2. \)

**The column 1 and column 3:**
- \((1). (\bar{1}) + (1). (\bar{-1}) + (1). (\bar{1}) + (1). (\bar{-1}) + (2). (\bar{\beta}) = 0 \implies \bar{\beta} = 0. \) So, \( \beta = 0. \)

**The column 1 and column 4:**
- \((1). (\bar{1}) + (1). (\bar{-1}) + (1). (\bar{-1}) + (1). (\bar{-1}) + (2). (\bar{\gamma}) = 0 \implies \bar{\gamma} = 0. \) So, \( \gamma = 0. \)

**The column 1 and column 5:**
- \((1). (\bar{1}) + (1). (\bar{-1}) + (1). (\bar{-1}) + (1). (\bar{1}) + (2). (\bar{\delta}) = 0. \implies \bar{\delta} = 0. \) Thus, \( \delta = 0. \)

Therefore, the elements of the last row will be 2, -2, 0, 0, and 0. Then, character table of \( D_4 \) will be.

| 3.3 Inducing a Linear Character of a Proper Subgroup up \( H \cong S_5 \) |

Let \( G \) be a group such that \( G \cong S_5 \). We want to give a faithful and irreducible monomial representation of \( G \) of degree \( n \). Thus, we must induce a linear character of a proper subgroup up \( H \cong S_5 \). In order to induce up to a character of \( G \) of degree \( n \) the subgroup \( H \) must be of index \( n \). In the following example, \( G \) has the following character table:
The character table of $G$

<table>
<thead>
<tr>
<th>Class</th>
<th>1 2 3 4 5 6 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>1 10 15 20 30 24 20</td>
</tr>
<tr>
<td>Order</td>
<td>1 2 2 3 4 5 6</td>
</tr>
</tbody>
</table>

\[
\begin{array}{ccccccc}
\text{p} = 2 & 1 & 1 & 1 & 4 & 3 & 6 & 4 \\
\text{p} = 3 & 1 & 2 & 3 & 1 & 5 & 6 & 2 \\
\text{p} = 5 & 1 & 2 & 3 & 4 & 5 & 1 & 7 \\
\end{array}
\]

| X.1 | + 1 1 1 1 1 1 1 |
| X.2 | + 1 -1 1 1 -1 1 -1 |
| X.3 | + 4 -2 0 1 0 -1 1 |
| X.4 | + 4 2 0 1 0 -1 -1 |
| X.5 | + 5 1 1 -1 -1 0 1 |
| X.6 | + 5 -1 1 -1 1 0 -1 |
| X.7 | + 6 0 -2 0 0 1 0 |

Now, we want to induce a linear character of $H$ up to a character of $G$ of degree 6. So, we have taken a subgroup $H$ of index 6 in $G$.

\[
\text{Index}(G,H); \quad 6
\]

Now, the proper subgroup $H \cong 5 : 2^2$ of $S_5$ all the linear of $H$ are lift to $H$ of irreducible characters $H/H'$ where $H'$ denotes the derived subgroup of $H$.

\[
G:=\text{PrimitiveGroup}(5,5); \\
\text{IsAbelian}(G); \quad \text{xx}:=G.1; \quad \text{yy}:=G.2; \\
S:=\text{Subgroups}(G); \\
\text{for } i \text{ in } [1..\#S] \text{ do if Index}(G,S[i]\text{`subgroup}) eq 6 \text{ then } i; \text{ end if; end for;} \\
H:=S[16]\text{`subgroup}; \\
dH:=\text{DerivedGroup}(H); \\
dH; \quad (1, 4, 5, 3, 2)
\]

Thus, $H' = \langle (1,4,5,3,2) \rangle \cong 5$. The number of distinct linear characters of $H$ is equal to $H/H' = \frac{20}{5} = 4$, so we will have 4 transversals.

Thus, $H/H' = \{H'e, H'(1,5,3,4), H'(1,3)(4,5), H'(1,4,3,5)\}$. 
\[ S := \text{Set}(dH); q := \{\{\text{Id}(H)\},\{\},\{\},\{\}; \]

for \( i \) in \([1..\#T]\) do for \( g \) in \( S \) do
\( q[i] := q[i] \cup \{g*T[i]\}; \)
end for; end for;
\( q; \)

\[
\begin{align*}
&\{ (1, 4, 5, 3, 2), \\
&(1, 3, 4, 2, 5), \\
&\text{Id}(H), \\
&(1, 2, 3, 5, 4), \\
&(1, 5, 2, 4, 3) \\
&\}, \\
&\{ (1, 4, 2, 3), \\
&(1, 3, 5, 2), \\
&(2, 5, 4, 3), \\
&(1, 5, 3, 4), \\
&(1, 2, 4, 5) \\
&\}, \\
&\{ (1, 2)(3, 4), \\
&(1, 4)(2, 5), \\
&(1, 3)(4, 5), \\
&(2, 4)(3, 5), \\
&(1, 5)(2, 3) \\
&\}, \\
&\{ (1, 2, 5, 3), \\
&(2, 3, 4, 5), \\
&(1, 4, 3, 5), \\
&(1, 3, 2, 4), \\
&(1, 5, 4, 2) \\
&\}
\end{align*}
\]

So, the conjugacy classes of \( H/H' \) are \( \{\text{Id}(H)\}, \{H'(1, 4, 2, 3)\}, \{H'(1, 2)(3, 4)\}, \) and \( \{H'(1, 2, 5, 3)\} \). Now, we will construct the character table of \( H/H' \). The character table of cyclic group has primitive 4 the root of unity =i as follows:
Table 3.4: Initial Character Table of Cyclic Group $Z_4$

<table>
<thead>
<tr>
<th>Classes</th>
<th>$e$</th>
<th>$a$</th>
<th>$a^2$</th>
<th>$a^3$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\chi^\bullet.1$</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>$\chi^\bullet.2$</td>
<td>1</td>
<td>i</td>
<td>$i^2$</td>
<td>$i^3$</td>
</tr>
<tr>
<td>$\chi^\bullet.3$</td>
<td>1</td>
<td>$i^2$</td>
<td>$(i^2)^2$</td>
<td>$(i^2)^3$</td>
</tr>
<tr>
<td>$\chi^\bullet.4$</td>
<td>1</td>
<td>$i^3$</td>
<td>$(i^3)^2$</td>
<td>$(i^3)^3$</td>
</tr>
</tbody>
</table>

Where $i^2 = -1$, $i^3 = -i$, and $(i^3)^3 = i^9 = (i^4)^2 i = i$. Therefore, this is equivalent to character table of $H/H' \cong Z_4$.

Table 3.5: Final Character Table of Cyclic Group $Z_4$

</tr>
</tbody>
</table>

Thus, we could build the character table of $H/H'$. Now, we can construct the character table of $H$ by lifting the character table of $H/H'$ to $H$.

To build the character table of $H$, we first need to figure out the conjugacy classes of $H$. The following set are the conjugacy classes of $H$ are \{e\}, \{(1, 2)(3, 4)\}, \{(1, 4, 2, 3)\}, \{(1, 2, 5, 3)\}, and \{(1, 4, 5, 3, 2)\}. So, we will construct the character table of $H$ with five rows and column since there are five conjugacy classes in $H$. Then, we will use the definition of lifting character, we will lift each irreducible character from $H/H'$ to $H$.

We note that, $\chi(h) = \chi^\bullet(h)$ for $h \in H$. 

First, the first row will be identity character.
Next, we find the second row by lifting \(X\cdot 2\) to \(H\).
\[(X\cdot 2e) = X\cdot 2(H'e) = 1.\]
\[(X\cdot 2(1, 2)(3, 4)) = X\cdot 2(H'(1, 2)(3, 4)) = i.\]
\[(X\cdot 2(1, 4, 2, 3)) = X\cdot 2(H'(1, 4, 2, 3)) = -1.\]
\[(X\cdot 2(1, 2, 5, 3)) = X\cdot 2(H'(1, 2, 5, 3)) = -i.\]
\[(X\cdot 2(1, 4, 5, 3, 2)) = X\cdot 2(H'(1, 4, 5, 3, 2)) = 1.\]
\[(\text{since}= X\cdot 2(H'(1, 4, 5, 3, 2)) = X\cdot 2(H'e)).\]

Now, we find the third row by lifting \(X\cdot 3\) to \(H\).
\[(X\cdot 3e) = X\cdot 3(H'e) = 1.\]
\[(X\cdot 3(1, 2)(3, 4)) = X\cdot 3(H'(1, 2)(3, 4)) = -1.\]
\[(X\cdot 3(1, 4, 2, 3)) = X\cdot 3(H'(1, 4, 2, 3)) = 1.\]
\[(X\cdot 3(1, 2, 5, 3)) = X\cdot 3(H'(1, 2, 5, 3)) = -1.\]
\[(X\cdot 3(1, 4, 5, 3, 2)) = X\cdot 3(H'(1, 4, 5, 3, 2)) = 1.\]
\[(\text{since}= X\cdot 3(H'(1, 4, 5, 3, 2)) = X\cdot 3(H'e)).\]

We will now find the fourth row by lifting \(X\cdot 4\) to \(H\).
\[(X\cdot 4e) = X\cdot 4(H'e) = 1.\]
\[(X\cdot 4(1, 2)(3, 4)) = X\cdot 4(H'(1, 2)(3, 4)) = -i.\]
\[(X\cdot 4(1, 4, 2, 3)) = X\cdot 4(H'(1, 4, 2, 3)) = -1.\]
\[(X\cdot 4(1, 2, 5, 3)) = X\cdot 4(H'(1, 2, 5, 3)) = i.\]
\[(X\cdot 4(1, 4, 5, 3, 2)) = X\cdot 4(H'(1, 4, 5, 3, 2)) = 1.\]
\[(\text{since}= X\cdot 4(H'(1, 4, 5, 3, 2)) = X\cdot 4(H'e)).\]

Lastly, we will fill the last row by using the orthogonality relations. We will suppose in the last row, we will have \(a, b, c, d,\) and \(f\), respectively. So, we need to compute these values. We use the fact that the sum of squares of the degrees of the distinct irreducible characters of \(H\) which is equal to \(|H|\) to find the first element of \(X^5\), it will be as follows:

- \(1^2 + 1^2 + 1^2 + 1^2 + a^2 = |H| = 20\). So, \(a^2 = 16\) then \(a = 4\).
We first have to note that if we collect different columns, they will equal zero by using this definition:

\[ \sum_{k=1}^{i} x^i_{\alpha} x^j_{\beta} = 0 \]

- The column 1 and column 2 of the character table of H:
  - (1).(\bar{1}) + (1).i + (1).(-\bar{1}) + (1).(-i) + (4).(\bar{b}) = 0 \implies \bar{b} = 0 . So, b = 0.
- The column 1 and column 3 of the character table of H:
  - (1).(\bar{1}) + (1).i + (1).(-\bar{1}) + (1).i + (4).(\bar{c}) = 0 \implies \bar{c} = 0 . So, c = 0.
- The column 1 and column 4 of the character table of H:
  - (1).(\bar{1}) + (1).(-i) + (1).\bar{1} + (1).\bar{i} + (4).(\bar{d}) = 0 \implies \bar{d} = 0 . So, d = 0.
- The column 1 and column 5 of the character table of H:
  - (1).(\bar{1}) + (1).\bar{1} + (1).\bar{1} + (1).\bar{1} + (4).(\bar{f}) = 0 \implies \bar{f} = -1 . So, f = -1.

Finally, we could fill our character table of H by lifting H/H’ to H.

Chapter 4

Isomorphism Type of Groups

4.1 Extensions and Related Definitions

Definition 4.1. [Rot95] \( G \) is a semi-direct product of two subgroups \( H \) and \( K \) if:

1. \( K \trianglelefteq G, \ Q \leq G. \)
2. \( G = KQ. \)
3. \( K \cap Q = 1. \)

Definition 4.2. [Rot95] Let \( G \) be a group. We say \( G \) is a direct product of two subgroups \( H \) and \( K \) if:

1. \( H \trianglelefteq G, \ K \trianglelefteq G. \)
2. \( G = HK. \)
3. \( H \cap K = 1. \)

Definition 4.3. [Rot95] Let \( G \) be a group and \( H, \ N \leq G \) such that \( |G| = |N||H|. \) \( G \) is a central extension by \( H \) if \( N \) is the center of \( G. \) We denote this by \( G \cong N^*H. \)

Definition 4.4. [Rot95] Let \( G \) be a group and \( H, \ N \leq G \) such that \( |G| = |N||H|. \) \( G \) is a mixed extension by \( H \) if it is a combination of both central extensions and semi-direct products, where \( N \) is the normal subgroup of \( G \) but not central. We denote this by \( G \cong N^* : H. \)
Definition 4.5. [Rot95] Let $G$ be a group. A composition series of $G$ given by:

$$G = G_0 \geq G_1 \geq \cdots \geq G_n = 1$$

is a normal series where, for all $i$, either $G_{i+1}$ is a maximal normal subgroup of $G_i$ or $G_{i+1} = G_i$.

Definition 4.6. [Rot95] If group $G$ has a composition series, the factor groups of its series are the composition factors of $G$.

Definition 4.7. [Rot95] The Dihedral Group $D_n$, $n$ even and greater than 2, groups are formed by two elements, one of order $\frac{n}{2}$ and one of order 2. A presentation for a Dihedral Group is given by $\langle a, b | a^{\frac{n}{2}}, b^2, (ab)^2 \rangle$.

Definition 4.8. [Rot95] A general linear group, $GL(n, \mathbb{F})$ is the set of all $n \times n$ matrices with nonzero determinant over field $\mathbb{F}$.

Definition 4.9. [Rot95] A special linear group, $SL(n, \mathbb{F})$ is the set of all $n \times n$ matrices with determinant 1 over field $\mathbb{F}$.

Definition 4.10. [Rot95] A projective special linear group, $PSL(n, \mathbb{F})$ is the set of all $n \times n$ matrices with determinant 1 over field $\mathbb{F}$ factored by its center:

$$PSL(n, \mathbb{F}) = L_n(\mathbb{F}) = \frac{SL(n, \mathbb{F})}{Z(SL(n, \mathbb{F}))}.$$ 

Definition 4.11. [Rot95] A projective general linear group, $PGL(n, \mathbb{F})$ is the set of all $n \times n$ matrices with nonzero determinant over field $\mathbb{F}$ factored by its center:

$$PGL(n, \mathbb{F}) = \frac{GL(n, \mathbb{F})}{Z(GL(n, \mathbb{F}))}.$$
4.2 Extensions Examples:

We can find the isomorphism types of the progenitors by solving the extension problem. To solve the extension problem we need to know the composition factors of groups. We will recognize in the following on four types of extensions which are direct product, a semi direct, central extension, and mixed extension. Moreover, we will provide an example of each one.

4.3 Semi Direct Product:

4.3.1 Verifications of $3^4 : ((3^2 \ast 2^3) \times 2)$

We found the following finite homomorphic image from the symmetric group $8 6 3 6 4 0 11664$ which produces the following group:

\[ G<x,y,z,w,h,t>:=\text{Group}<x,y,z,w,h,t|x^2,y^2,z^2,w^4,h^2,(y*z)^2,(x*w^{-1})^2,(y*w^{-1})^2,z*w^{-1}z*w,w^{-2}*h,x*y*x*y*w^{-1},x*z*x*z*h,t^2,(t,x),(y*t)^6,(z*w*t)^3,(z*x*t)^6,(y*x*t)^4,(y*x*z*t)^0>; \]

Our order group is equal 11664, and this group has the following composition factors:

<table>
<thead>
<tr>
<th></th>
<th>Cyclic(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Cyclic(2)</td>
</tr>
<tr>
<td></td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Cyclic(2)</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>Cyclic(3)</td>
</tr>
<tr>
<td></td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>Cyclic(3)</td>
</tr>
</tbody>
</table>
Now, we will prove the isomorphism type of $G$.

The composition series for $G$ is:

$$G = G_0 \supseteq G_1 \supseteq G_2 \supseteq G_3 \supseteq G_4 \supseteq G_5 \supseteq G_6 \supseteq G_7 \supseteq G_8 \supseteq G_9 \supseteq G_{10}$$

where $G_{10} = 1$.

The composition factors are:

$$G = \left( G_0 \setminus G_1 \right) \left( G_1 \setminus G_2 \right) \left( G_2 \setminus G_3 \right) \left( G_3 \setminus G_4 \right) \left( G_4 \setminus G_5 \right) \left( G_5 \setminus G_6 \right) \left( G_6 \setminus G_7 \right) \left( G_7 \setminus G_8 \right) \left( G_8 \setminus G_9 \right) \left( G_9 \setminus G_{10} \right)$$

$$= \left( G_0 \setminus G_1 \right) \left( G_1 \setminus G_2 \right) \left( G_2 \setminus G_3 \right) \left( G_3 \setminus G_4 \right) \left( G_4 \setminus G_5 \right) \left( G_5 \setminus G_6 \right) \left( G_6 \setminus G_7 \right) \left( G_7 \setminus G_8 \right) \left( G_8 \setminus G_9 \right) \left( G_9 \setminus 1 \right)$$

$$= C_3 C_3 C_3 C_2 C_3 C_3 C_2 C_2 C_2$$

The normal lattice of $G$ is as follows:

Normal subgroup lattice
-----------------------

<table>

</tbody>
</table>
Next, we will ask Magma about the largest abelian group by this loop:

```magma
for i in [1..#NL] do if IsAbelian(NL[i]) then i; end if; end for;
```

1
2
3
4

So, we see that the largest abelian group is NL[4] of order 81 from our normal lattice of G1. We first need to find the isomorphism type of NL[4], which has 3 possibilities, such as $3 \times 3 \times 3 \times 3$, $3^4$, and $3^3 \times 3$.

We check and find the following:

```magma
Permutation group acting on a set of cardinality 729
Order = 81 = 3^4
X:=[3,3,3,3];
IsIsomorphic(NL[4],AbelianGroup(GrpPerm, (X)));
true
```

As a result, we found that $NL[4] = 3^4$. Now, we can produce a presentation for NL[4] as follows:

```magma
FPGroup(NL[4]);
Finitely presented group on 4 generators
Relations
$.1^3 = Id($)
$.2^3 = Id($)
$.3^3 = Id($)
$.4^3 = Id($)
```
$(.1, .2) = \text{Id}(S) \\
$(.1, .3) = \text{Id}(S) \\
$(.2, .3) = \text{Id}(S) \\
$(.1, .4) = \text{Id}(S) \\
$(.2, .4) = \text{Id}(S) \\
$(.3, .4) = \text{Id}(S) \\
S<a,b,c,d>:=\text{Group}<a,b,c,d| a^3,b^3,c^3,d^3, (a,b), (a,c), (b,c), (a,d), (b,d), (c,d)>; \\
ff,ss,kk:=\text{CosetAction}(S, \text{sub}<S|\text{Id}(S)>); \\
s,t:=\text{IsIsomorphic}(ss,NL[4]); \\
s; \\
true

Now, we will factor $G_1$ by $NL[4]$ resulting $q$ which is the quotient group.

$H:=NL[4]; \\
q,ff:=\text{quo}<G_1|NL[4]>;q; \\
\text{Permutation group } q \text{ acting on a set of cardinality 12} \\
\text{Order } = 144 = 2^4 \cdot 3^2

Consider the composition factor of $q$ as follows:

\text{CompositionFactors}(q); \\
G \\
| \text{Cyclic}(2) \\
| \text{Cyclic}(2) \\
| \text{Cyclic}(3) \\
| \text{Cyclic}(2) \\
| \text{Cyclic}(2) \\
| \text{Cyclic}(3) \\
| 1

We will now find the normal lattice for $q$ by this Magma loop:

$$nl:=\text{NormalLattice}(q); \\
nl;$$

Normal subgroup lattice of $q$

[21] Order 144 Length 1 Maximal Subgroups: 14 15 16 
17 18 19 20
We now check if we have a direct product or not, so we want to see if $q$ is collected of a direct product. As a result, we could find the direct product between two normal subgroups which are $\text{nll}[17]$ and $\text{nll}[2]$. The product of their order give me the order of $q=144$. To make sure by this Magma code:

```magma
E:=DirectProduct(nl[17],nl[2]);
IsIsomorphic(E,q);
```

We find that $q$ is isomorphic to $\text{nll}[17]$ and $\text{nll}[2]$, where $\text{nll}[17] \cong 3^2 \times 2^3$ and $\text{nll}[2] \cong 2$. The presentation of $q \cong \text{nll}[17] \times \text{nll}[2]$ which is obtained from \text{FPGroup}(q):

```magma
H<e,f,g,h,o>:=Group<e,f,g,h,o|e^2,f^2,g^2,h^2,o^2,(e*g)^2,(f*g)^2,(e*h)^2,(f*h)^2,(g*h)^2,(e*o)^2,(g*o)^2,e*f*e*f*h,h*o*h*g*o*h*o,(f*o*f*o*h)^2>;
```
ff, ss, kk := CosetAction(H, sub<H|Id(H)>);

s, t := IsIsomorphic(q, ss);
s;
true

Now, we will check the relation between NL[4] and q. Since our q is not the center of G, so we do not have a central extension. Also, we do not have direct product between NL[4] and q, so we do not have direct product. Then, we only have two options which are a semi direct product or mixed extension.

We will label our generators of q as follows:

EE := q!(2, 4)(5, 6)(7, 11)(8, 10)(9, 12);

FF := q!(1, 2)(3, 4)(5, 7)(6, 9)(8, 12)(10, 11);

GG := q!(1, 3)(2, 4)(5, 6)(7, 9)(8, 10)(11, 12);

DD := q!(1, 3)(2, 4)(5, 8)(6, 10)(7, 12)(9, 11);

KK := q!(2, 5)(4, 6)(7, 11)(9, 12);

Also, we will label our generators of NL[4] as follows:

A := G1!NL[4] . 1;

B := G1!NL[4] . 2;

C := G1!NL[4] . 3;

D := G1!NL[4] . 4;

H := G1!T[2];

J := G1!T[3];

I := G1!T[4];

M := G1!T[5];

O := G1!T[6];

Here a, b, c, and d represent elements of NL[4], and e, f, g, h, and o represent elements of q. Where A, B, C, and D ≡ a, b, c, and d, respectively and H, J, I, M, and O ≡ e, f, g, h, and o, respectively. Now, we need to check the action q on NL[4] by the following Magma code:

for i, j, k, l in [1..3] do if A^H eq A^i*B^j*C^k*D^l then i, j, k, l; end if; end for;
1 3 3 3 ----> a^e=a

for i, j, k, l in [1..3] do if A^J eq A^i*B^j*C^k*D^l then i, j, k, l; end if; end for;
1 3 1 3 ----> a^f=a*c
for $i, j, k, l$ in $[1..3]$ do if $A^i = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

2 3 3 3 ---> $a^g = a^2$

for $i, j, k, l$ in $[1..3]$ do if $A^M = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

1 1 3 3 ---> $a^h = a \cdot b$

for $i, j, k, l$ in $[1..3]$ do if $A^O = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

2 3 3 3 ---> $a^o = a^2$

for $i, j, k, l$ in $[1..3]$ do if $B^H = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 1 3 3 ---> $b^e = b$

for $i, j, k, l$ in $[1..3]$ do if $B^J = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 1 1 3 ---> $b^f = b \cdot c$

for $i, j, k, l$ in $[1..3]$ do if $B^I = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 2 3 3 ---> $b^g = b^2$

for $i, j, k, l$ in $[1..3]$ do if $B^M = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 2 3 3 ---> $b^h = b^2$

for $i, j, k, l$ in $[1..3]$ do if $B^O = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 1 3 3 ---> $b^o = b$

for $i, j, k, l$ in $[1..3]$ do if $C^H = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 1 2 3 ---> $c^e = b \cdot c^2$

for $i, j, k, l$ in $[1..3]$ do if $C^J = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 3 2 3 ---> $c^f = c^2$

for $i, j, k, l$ in $[1..3]$ do if $C^I = A^i \cdot B^j \cdot C^k \cdot D^l$ then $i, j, k, l$; end if; end for;

3 3 2 3 ---> $c^g = c^2$
for i, j, k, l in [1..3] do if C^M eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

for i, j, k, l in [1..3] do if C^O eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

for i, j, k, l in [1..3] do if D^H eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

for i, j, k, l in [1..3] do if D^J eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

for i, j, k, l in [1..3] do if D^I eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

for i, j, k, l in [1..3] do if D^M eq A^i*B^j*C^k*D^l then
  i, j, k, l;
end if; end for;

Finally, we put presentations of q and NL[d] together with $a^e = a, a^f = a*c,$

$\begin{align*}
  a^g &= a^2, \\
  a^h &= a * b, \\
  a^o &= a^2, \\
  b^f &= b * c, \\
  b^g &= b^2, \\
  b^h &= b^2, \\
  b^o &= b, \\
  c^e &= b * c^2, \\
  c^f &= c^2, \\
  c^g &= c^2, \\
  c^h &= c^2, \\
  c^o &= c * d^2, \\
  d^e &= d^2, \\
  d^f &= d, \\
  d^h &= d, \\
  d^o &= d^2.
\end{align*}$

Thus,

$\begin{align*}
  M < a, b, c, d, e, f, g, h, o > := \text{Group} < a, b, c, d, e, f, g, h, o | a^3, b^3, \\
  c^3, d^3, (a, b), (a, c), (b, c), (a, d), (b, d), (c, d), \\
  e^2, f^2, g^2, h^2, o^2, (e*g)^2, (f*g)^2, (e*h)^2, \\
  (f*h)^2, (g*h)^2, (e*o)^2, (g*o)^2, \\
  e*f*e*f*h, h*o*h*g*o*h, (f * o * f * o * h)^2, \\
  a^e = a, a^f = a*c, a^g = a^2, a^h = a*b, a^o = a^2, \\
  b^e = b, b^f = b*c, b^g = b^2, b^h = b^2, \\
  b^o = b, c^e = b*c^2, c^f = c^2, c^g = c^2, c^h = c^2, c^o = c*d^2,
\end{align*}$
We will now check if $M$ is given above and $G_1$ are isomorphic?

```plaintext
#M;
11664
#G1;
11664
f1,M1,k1:=CosetAction(M,sub<M|Id(M)>);
s:=IsIsomorphic(G1,M1);
s;
true
```

Therefore, $M$ and $G_1$ are isomorphic. The isomorphism type of our group $G$ is $3^4 : (3^2 \times 2^3) \times 2$. 
4.4 Verification of $2^9 : PGL(2,7)$

We begin the process with the presentation of $G$ given as follows:

$$G<x, y, z, t> := \text{Group} <w, x, y, z, t \mid w^2, x^2, y^4, z^2, (w*y-1)^2, x*y^2, y^2*z, w*x*w*x*z, t^2, (t, w), (x*t)^8, (y*t)^3, (x*w*t)^7>.$$ 

The order of our group is equal 172032. We will now prove the isomorphism type of $G$.

To prove that we have to know the compositions factors of $G$.

CompositionFactors(G1);

$G$

| Cyclic(2)  
| Cyclic(2)  
| A(1, 7) = L(2, 7)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  
| Cyclic(2)  

The composition series for $G$ is:

$G = G_0 \supseteq G_1 \supseteq G_2 \supseteq G_3 \supseteq G_4 \supseteq G_5 \supseteq G_6 \supseteq G_7 \supseteq G_8 \supseteq G_9 \supseteq G_{10} \supseteq G_{11}$

where $G_{11} = 1$.

The composition factors are:

$G = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus G_7)(G_7 \setminus G_8)$
The normal lattice of $G_1$ is as follows:

Normal subgroup lattice
-----------------------
[9] Order 172032 Length 1 Maximal Subgroups: 6 7 8
---
[8] Order 86016 Length 1 Maximal Subgroups: 5
---
---
---
[3] Order 256 Length 1 Maximal Subgroups: 1
---
[2] Order 2 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:

Looking at the normal lattice of $G$ we note the largest abelian group $NL[4]$ of order 512.

$NL[4]$; Permutation group acting on a set of cardinality 10752
Order = 512 = $2^9$

We can write the isomorphism type of $NL[4]$ such as $2^9$. We will use this loop to make sure $NL[4] \cong 2^9$.

```plaintext
 X:=[2,2,2,2,2,2,2,2,2];
 IsIsomorphic(NL[4],AbelianGroup(GrpPerm,(X)));
true
```

Now, we will write the presentation of $NL[4]$ by FPGroup(NL[4]).

```plaintext
S<w,x,y,z,h,o,p,u,r>:={Group<w,x,y,z,h,o,p,u,r|
w^2,x^2,y^2,z^2,h^2,o^2,p^2,u^2,r^2,(w*x)^2,
```
Next, we will factor \( G_1 \) by \( \text{NL}[4] \) resulting \( q \) which is the quotient group.

\[
H := \text{NL}[4];
q, ff := \text{quo}<G_1|\text{NL}[4]>;
q;
\]
Permutation group \( q \) acting on a set of cardinality 8
Order = \( 336 = 2^4 \times 3 \times 7 \)

So, we found the order of \( q=336 \) and the composition factors of \( q \) as follows:

\[
\text{CompositionFactors}(q);
G
| \text{Cyclic}(2)
*  
| \text{A}(1, 7) = L(2, 7)
1
\text{IsIsomorphic(PGL}(2,7),q);
\text{true}
\]

We can see that \( q \) is isomorphic to \( PGL(2,7) \).

Now, we will find our presentation for \( q \) by using \( \text{FPGroup}(q) \). It gives us the following presentation for \( q \):

\[
H<a,b,c>: = \text{Group}<a,b,c|a^2,b^2,c^2, (a*b)^2, (c*b)^3, 
(a*c)^8,b*a+c*b+a+c*b+a+c*b+a+c*b+a+c*b+a*c*b+c+a*b*c>;
ff, ss, kk := \text{CosetAction}(H, \text{sub}<H|\text{Id}(H)>);
\]

\[
s, t := \text{IsIsomorphic}(q, ss);
\]
\text{true}

From previous steps, we could know \( \text{NL}[4] \) and \( q \) what are. Now, we want to figure out what the isomorphic types between them since our \( q \) is not the center of \( G \), so we
do not have a central extension. Also, there is no normal subgroup of order 336 in \(G\) that intersects with \(\text{NL}[4]\) of order 512. Therefore, we do not have a direct product extension. So, it remains two possibilities which are a semi direct or mixed extension. If we can write a presentation with the action of the generators of \(H\) on the generators of \(\text{NL}[4]\), so \(G\) is a semi-direct product.

\[
T := \text{Transversal}(G_1, \text{NL}[4]);
\]

\[
\text{EE} := q!(1, 2)(3, 4)(5, 6)(7, 8);
\]

\[
\text{FF} := q!(1, 2)(5, 7)(6, 8);
\]

\[
\text{GG} := q!(2, 3)(4, 5)(6, 8);
\]

\[
\text{ff}(T[2]) \text{ eq } \text{EE};
\]

\[
\text{true}
\]

\[
\text{ff}(T[3]) \text{ eq } \text{FF};
\]

\[
\text{true}
\]

\[
\text{ff}(T[4]) \text{ eq } \text{GG};
\]

\[
\text{true}
\]

\[
q \text{ eq } \text{sub}<q|\text{EE,FF,GG}>;
\]

\[
\text{true}
\]

\[
A := G_1!\text{NL}[4].1;
\]

\[
B := G_1!\text{NL}[4].2;
\]

\[
C := G_1!\text{NL}[4].3;
\]

\[
D := G_1!\text{NL}[4].4;
\]

\[
F := G_1!\text{NL}[4].5;
\]

\[
H := G_1!\text{NL}[4].6;
\]

\[
P := G_1!\text{NL}[4].7;
\]

\[
O := G_1!\text{NL}[4].8;
\]

\[
V := G_1!\text{NL}[4].9;
\]

\[
J := G_1!T[2];
\]

\[
I := G_1!T[3];
\]

\[
M := G_1!T[4];
\]

Next, we need to store the generators of \(\text{NL}[4]\). We will indicate to the generators of \(\text{NL}[4]\) as \(A, B, C, D, F, H, P, O\) and \(V\) and the generators of \(q\) as \(\text{EE, FF, and GG}\). Now, we can use the following code to determine the action of \(q\) on \(\text{NL}[4]\).

\[
\text{for } i, j, k, l, m, mm, ii, jj, kk \text{ in } [1..2] \text{ do if } A^i B^j C^k D^l F^m H^mm P^i O^jj V^kk \text{ then end if; end for;}
\]

\[
1 2 1 2 2 2 2 2
\]

\[
\text{for } i, j, k, l, m, mm, ii, jj, kk \text{ in } [1..2] \text{ do if } A^i B^j C^k D^l F^m H^mm P^i O^jj V^kk \text{ then end if; end for;}
\]
for i, j, k, l, m, mm, ii, jj, kk in [1..2] do if A^M eq A^i*B^j*C^k*D^l*F^m*H^mm*P^ii*O^jj*V^kk then i, j, k, l, m, mm, ii, jj, kk; end if; end for;

We indicated here only the generator A of NL[4] which be raised by J, I and M. All the elements in NL[4] are order 2. We will repeat this process for each of remaining generators of NL[4] (B, C, ..., V) which can be found in the appendix. Now, we can find the action of q on NL[4] which are

\[ w^a = w*y, w^b = w*y, w^c = w, x^a = x*y, x^b = x, \]
\[ x^c = x*y*z, y^a = y, y^b = y, y^c = z, z^a = y*z*u, z^b = y*z, z^c = y, h^a = h, \]
\[ h^b = y*h, h^c = y*h*o*u, o^a = y*h*o*p*u, o^b = x*a, o^c = y*o, p^a = p, \]
\[ p^b = p, p^c = y*h*o*p*r, u^a = u, u^b = u, u^c = z*a, r^a = p*r, r^b = p*u*r, r^c = y*z*r. \]

Lastly, we will collect the presentation NL[4] and q with the action of q on NL[4] words into one presentation as follows.

\[
H\langle w, x, y, z, h, o, p, u, r, a, b, c \rangle := \text{Group}\langle w, x, y, z, h, o, p, u, r, a, b, c | w^2, \\
\quad x^2, y^2, z^2, h^2, o^2, p^2, u^2, r^2, (w * x)^2, \\
\quad (w * y)^2, (x * y)^2, (w * z)^2, (x * z)^2, (y * z)^2, \\
\quad (w * h)^2, (x * h)^2, (y * h)^2, (z * h)^2, (w * o)^2, \\
\quad (x * o)^2, (y * o)^2, (z * o)^2, (h * o)^2, (w * p)^2, (x * p)^2, \\
\quad (y * p)^2, (z * p)^2, (h * p)^2, (o * p)^2, (w * u)^2, \\
\quad (x * u)^2, (y * u)^2, (z * u)^2, (h * u)^2, \\
\quad (o * u)^2, (p * u)^2, (w * r)^2, (x * r)^2, (y * r)^2, (z * r)^2, \\
\quad (h * r)^2, (o * r)^2, (p * r)^2, (u * r)^2, (w * y)^2, (w * b = w * y, w * c = w, \\
\quad x^a = x*y, x^b = x, x^c = x*y*z, y^a = y, y^b = y, y^c = z, \\
\quad z^a = y*z*u, z^b = y*z, z^c = y, h^a = h, h^b = y*h, h^c = y*h*o*u, \\
\quad o^a = y*h*o*p*u, o^b = x*o*u, o^c = y*u, p^a = p, p^b = p, p^c = y*h*o*p*r, \\
\quad u^a = u, u^b = u, u^c = z, o^a = p*r, o^b = u*r, o^c = y*z*r, a^2, b^2, \\
\quad c^2, (a*b)^2, (c*b)^3, (a*c)^8, b*a*c*b*a*c*b*a*c*b*a*c*b*a*c*b; \rangle
\]

#H; #G1;

172032

f1, H1, k1 := CosetAction(H, sub<H|Id(H)>); s := IsIsomorphic(G1, H1); s;

true

Therefore, we have semi direct \( G \cong \mathbb{Z}_2^9 : PGL(2,7) \)
4.5 Central Extension

To investigate an extension is a central extension, or not we first need to compute the center of our group. If it is larger more than one and equal the largest abelian group, so we will have a central extension.

4.5.1 Verification of $2^*S_6$

We begin the process with the presentation of $G$ given as follows:

\[
G \left< w, x, y, z, t \right> = \text{Group}<w, x, y, z, t \mid w^2, x^2, y^4, z^2, (w*y^-1)^2, x*y^-1*x*y, \\
y^-2*z, w*x*w*x*z, t^2, (t, w), (x*t)^8, (x*y^-1*t)^5, (y*t)^4, (x*w*t)^0, \\
(w*x*y*t)^5, (w*x*y*t)^0>;
\]

The order of our group is equal 1440. We will now find the compositions factors of our group to recognize if we have a central extension or not.

\[
\text{CompositionFactors}(G1);
\]

\[
G \\
| \text{Cyclic}(2) \\
| \text{Alternating}(6) \\
| \text{Cyclic}(2) \\
1
\]

The composition series for $G$ is:

$G = G_0 \trianglerighteq G_1 \trianglerighteq G_2 \trianglerighteq G_3$ where $G_3 = 1$.

The composition factors are:

$G = (G_0 \backslash G_1)(G_1 \backslash G_2)(G_2 \backslash G_3)$

$= (G_0 \backslash G_1)(G_1 \backslash G_2)(G_2 \backslash 1)$

$= (G_0 \backslash G_1)(G_1 \backslash G_2)G_2$

$= C_2A_6C_2$
Now, Magma will help us to determine if $G_1$ has a center. If we have a center then, we are looking for which element in the normal lattice is the center.

```magma
Center(G1);
```
```
Permutation group acting on a set of cardinality 360
Order = 2
Center(G1) eq NL[2];
true
```

The presentation of $NL[2]$ is

```magma
S<e>:=Group<e|e^2>;
ff,ss,kk:=CosetAction(S,sub<S|Id(S)>);
s,t:=IsIsomorphic(ss,NL[2]);
s;
true
```

Next, we can factor $G_1$ by the center and define the isomorphism type of the resulting factor group $q$. We can see the compositions factors of $q$ and normal lattice as follows:

```magma
CompositionFactors(q);
```
```
G |
  | Cyclic(2)
  | Alternating(6)
1
```

```magma
nl:=NormalLattice(q);
nl;
```
```
Normal subgroup lattice
-----------------------
[7] Order 1440 Length 1 Maximal Subgroups: 4 5 6
---
---
[3] Order 360 Length 1 Maximal Subgroups: 1
---
[2] Order 2 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:
```
We could figure out from the compositions factors of $q$ that $q \cong S_6$ where the order of $S_6$ is equal 720.

We find a presentation of $S_6$ by [WB99] as a reference, then we use Magma to make sure if our presentation is correct or not as follows:

```plaintext
H<a,b,c>:=Group<a,b,c|a^2,b^2,c^2,(a*b)^2,
(b*c)^4,b*a*c*b*a*c*b*a*c*b*a*c*b*c,
(a*c)^8,c*a*c*b*c*a*c*b*c*a*c*b*c*a*c*b*c;b;
ff,ss,kk:=CosetAction(H,sub<H|Id(H)>);
s,t:=IsIsomorphic(q,ss);
s;
true
```

Thus, our presentation of $S_6$ is correct. Then, we have to write the generators of $S_6$ in terms of the generators of the center. Now, we need to find transversals.

```plaintext
T:=Transversal(G1,NL[2]);
EE:=q!q.2;
FF:=q!q.3;
GG:=q!q.5;
q,ff:=quo<G1|NL[2]>;
ff(T[3]) eq FF;
true
ff(T[2]) eq EE;
true
ff(T[4]) eq GG;
true
q eq sub<q|EE,FF,GG>;
true
A:=G1!NL[2].2;
J:=G1!T[2];
I:=G1!T[3];
M:=G1!T[4];
```
J, I, and M represent the generators of $S_6$ and A represents $NL[2]$ which is the center.

Now, we can use the following code to determine the action of q on the center.

```plaintext
for i in [1..2] do if A^J eq A^i then i; end if; end for;
1 ---> e^J=e
for i in [1..2] do if A^I eq A^i then i; end if; end for;
1 ---> e^I=e
for i in [1..2] do if A^M eq A^i then i; end if; end for;
1 ---> e^M=e
```

Now, we add these relations $e^J = e$, $e^I = e$, and $e^M = e$ with the presentation of center to the presentation of q and check if it is isomorphic to G.

```plaintext
H<a,b,c,e>:=Group<a,b,c,e|a^2,b^2,c^2,(a*b)^2,(b*c)^4,
b*a*c*b*a*c*b*c*a*b*c,(a * c)^8,
c * a * c * b * c * a * c * b * a * c * b * c * a * c
*b * c * a * c * b*e^2,e^a=e,e^b=e,e^c=e>; #H;
1440
#G1;
1440
f1,H1,k1:=CosetAction(H,sub<H|Id(H)>); #IsIsomorphic(G1,H1);
s;
true
```

Therefore, we have a central extension $2 \cdot S_6$.

### 4.6 Isomorphism Type of $G = 2*16 : (5^4 : (D_4 \times S_3))$

Our presentation is given by:

```plaintext
G=< x, y, z, w, h, t | x^2, y^2, z^2, w^4, h^2, (y*w)^2, (x*w^-1)^2, (y*w^-1)*z*w, w^-2*h, x*
y*x*y*w^-1, x*z*x*z*h, t^2, (t,x), (y*t)^4, (z*w*t)^0, (z*x*t)^3, (y*x*t)^10, (y*x*z*t)^6 >.
```

Now, we will use a few Magma commands to find a minimal faithful permutation representation of G1. To Create an image of G, we will use this code.

```plaintext
f,G1,k:=CosetAction(G,sub<G|x,y>);G1;
300000
```

To find all subgroups of G, and gather all subgroups which are found in SL, we will use the following codes.
SL:=Subgroups(G1);
T :=\{X \text{ \textbackslash subgroup: } X \text { in SL}\};
\#T;
724

To determine faithful permutation representations of G.

TrivCore := \{H: H \text { in } T \mid \# \text {Core}(G1,H) \text { eq 1}\};
\#TrivCore;
670

This code gives us permutation representations of the smallest degree.

mdeg := Min\{\text {Index}(G1,H):H \text { in TrivCore}\};

To determine how many faithful permutation representations have a minimal number of letters by the following code.

Good := \{H: H \text { in TrivCore}\mid \text {Index}(G1,H) \text { eq mdeg}\};
\#Good;
6

To pick a representative from Good.

H := \text {Rep}(Good);
\#H;
1000

To create a permutation representation of the chosen representative from Good.

f,G1,K := CosetAction(G1,H);
G1;

Originally Permutation group G1 acting on a set of cardinality 3750
Order = 30000 = 2^4 \ast 3 \ast 5^4
now, our Permutation group G1 acting on a set of cardinality 30
Order = 30000 = 2^4 \ast 3 \ast 5^4

Now, we will take the permutation representation of G1 which is found above and find its isomorphism type. Our composition factors of our group as follows:
Now, we will prove the isomorphism type of $G_1$.

The composition series for $G_1$ is:

$G = G_0 \supset G_1 \supset G_2 \supset G_3 \supset G_4 \supset G_5 \supset G_6 \supset G_7 \supset G_8 \supset G_9$ where $G_9 = 1$.

The composition factors are:

$G = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus G_7)(G_7 \setminus G_8)(G_8 \setminus G_9) = C_5 C_5 C_5 C_5 C_2 C_2 C_2 C_3 C_2$

Next, we have to find the normal lattice of $G$ and ask Magma about the largest abelian subgroup in the normal lattice.

```plaintext
NL := NormalLattice(G1); NL;
[26] Order 30000 Length 1 Maximal Subgroups: 19 20 21 22 23
    24 25
---
[24] Order 15000 Length 1 Maximal Subgroups: 12 14 17
[23] Order 15000 Length 1 Maximal Subgroups: 15 17 18
[22] Order 15000 Length 1 Maximal Subgroups: 12 16 18
```
So, we see that the largest abelian group $NL[2]$ of order 625 by the normal lattice of $G_1$. Now, we check if $NL[2]$ isomorphic to $5^4$ by the following Magma code.

```magma
X:=[5,5,5,5];
IsIsomorphic(NL[2],AbelianGroup(GrpPerm,(X)));
true
```

Therefore, we could see that $NL[2] = 5^4$.

Next, we have to create a presentation for $NL[2]$ as follows:  

$$S = < w, x, y, z | w^5, x^5, y^5, z^5, (w, x), (w, y), (x, y), (w, z), (x, z), (y, z) >.$$
We could create a presentation for \( q \) as follows:

\[
H = \langle e, f, g, h, v | e^2, f^2, g^2, h^2, v^2, (e * g)^2, (f * g)^2, (e * h)^2, (f * h)^2, (g * h)^2, (e * v)^2, (h * v)^2, e * f * e * f * h, v * e * f * e * v * f, g * v * g * e * v * g * v \rangle.
\]

Now, we want to check if \( q \) which has order of 144 is gathered of a direct product or not. Thus, we could see that the direct product between two normal subgroups which are \( \text{nl}[10] \) and \( \text{nl}[7] \).

\[
E = \text{DirectProduct} (\text{nl}[10], \text{nl}[7]);
\]

\[
\text{IsIsomorphic}(E, q);
\]
true

Note, we found that \( \text{nl}[10] \) is isomorphic to dihedral group which is \( D_4 \) and \( \text{nl}[7] \) is isomorphic to symmetric group which is \( S_3 \) by this Magma loop.

\[
\text{nl}[10];
\]
Permutation group acting on a set of cardinality 12
Order = 8 = 2^3
(2, 5) (6, 8) (10, 12)
(1, 2) (3, 5) (4, 8) (6, 7) (9, 12) (10, 11)
(1, 3) (2, 5) (4, 7) (6, 8) (9, 11) (10, 12)
IsIsomorphic(DihedralGroup(4),nl[10]);
true

\[
\text{nl}[7];
\]
Permutation group acting on a set of cardinality 12
Order = 6 = 2 * 3
(1, 3) (2, 5) (4, 11) (6, 12) (7, 9) (8, 10)
(1, 4, 9) (2, 8, 12) (3, 7, 11) (5, 6, 10)
IsIsomorphic(nl[7],SymmetricGroup(3));
true

From the previous steps, we find \( q = D_4 \times S_3 \) and \( \text{NL}[2] = \mathbb{Z}_4 \). We do not have a central extension between \( \text{NL}[2] \) and \( q \) because the center of this group equal 1, so we have only two options to explain the relation between \( \text{NL}[2] \) and \( q \) which are a semi direct or mixed extension. Now, we will label our generators of \( q \) as the follows:

\[
\begin{align*}
\text{EE} &= q!q.1 \\
\text{FF} &= q!q.2 \\
\text{GG} &= q!q.3 \\
\text{DD} &= q!q.4 \\
\text{CC} &= q!q.6
\end{align*}
\]

Also, we will label our generators of \( \text{NL}[2] \) as follows:

\[
\begin{align*}
\text{A} &= \text{G1!NL}[2].1 \\
\text{B} &= \text{G1!NL}[2].2 \\
\text{C} &= \text{G1!NL}[2].3 \\
\text{D} &= \text{G1!NL}[2].4 \\
\text{J} &= \text{G1!T}[2] \\
\text{I} &= \text{G1!T}[3] \\
\text{M} &= \text{G1!T}[4] \\
\text{O} &= \text{G1!T}[5] \\
\text{Q} &= \text{G1!T}[6]
\end{align*}
\]
Here w, x, y, and z represent elements of NL[2], and e, f, g, h, and v represent elements of q. Where A, B, C, and D \cong w, x, y, and z, respectively and J, I, M, O, and Q \cong e, f, g, h, and v, respectively. Now, we need to check the action q on NL[2]. I will write here only action q on A, but B, C, and D will be in appendix. The Magma code:

```magma
for i,j,k,l in [1..5] do if A^J eq A^i*B^j*C^k*D^l then
  i,j,k,l;
end if; end for;
4 5 5 5 --> w^e = w^4

for i,j,k,l in [1..5] do if A^I eq A^i*B^j*C^k*D^l then
  i,j,k,l;
end if; end for;
4 4 5 5 --> w^f = w^4*x^4

for i,j,k,l in [1..5] do if A^M eq A^i*B^j*C^k*D^l then
  i,j,k,l;
end if; end for;
5 2 3 1 --> w^g = x^2*y^3*z

for i,j,k,l in [1..5] do if A^O eq A^i*B^j*C^k*D^l then
  i,j,k,l;
end if; end for;
4 5 5 5 --> w^h = w^4

for i,j,k,l in [1..5] do if A^Q eq A^i*B^j*C^k*D^l then
  i,j,k,l;
end if; end for;
1 5 5 5 --> w^v = w
```

Finally, the presentation of $G = 2^{16} : (5^4 : (D_4 \times S_3))$ as follows:

```
M<w,x,y,z,e,f,g,h,v|w^5,x^5,y^5,z^5,(w,x),(w,y),(x,y),
(w,z),(x,z),(y,z),e^2,f^2,g^2,h^2,v^2,(e*g)^2,(f*g)^2,
(e*h)^2,(f*h)^2,(g*h)^2,(e*v)^2,(h*v)^2,
(e*f*e*f*h,v*e*f*e*v*f,g*v*g*e*v*g*v,
w^e=w^4,w^f=w^4*x^4,w^g=x^2*y^3*z,

4.7 Mixed Extensions

A mixed extension is an incorporation of a semi-direct product and a central extension. When we have a center which is not the largest group, so we will have a mixed extension denoted $\cdot$.

4.7.1 Verification of $G \cong 3 \cdot PSL(2, 19) \times 2$

Our presentation is given by:

\[ G = \langle y, w, t | y^2, w^3, (y \ast w^{-1})^2, t^2, (t, y), (y \ast t)^2, (w \ast t)^{10}, (y \ast w^{-1} \ast t)^9 \rangle. \]

Also, the composition factors of this group is as follows:

\[
\text{CompositionFactors}(G1);
\text{G}
\mid \text{A}(1, 19) = \text{L}(2, 19)
\mid \text{Cyclic}(2)
\mid \text{Cyclic}(3)
\mid 1
\]

The composition series for $G$ is:

\[ G = G_0 \supseteq G_1 \supseteq G_2 \supseteq G_3 \text{ where } G_3 = 1. \]

The composition factors are:

\[ G = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3) \]
\[ = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus 1) \]
\[ = (G_0 \setminus G_1)(G_1 \setminus G_2)G_2 \]
\[ = C_3C_2PSL(2, 19). \]

Now, we can see from the normal lattice of $G$ that NL[2] is the largest abelian subgroup.

Normal subgroup lattice

| Order 20520 | Length 1 | Maximal Subgroups: 3 5 |
| Order 10260 | Length 1 | Maximal Subgroups: 2 4 |
| Order 3420  | Length 1 | Maximal Subgroups: 1   |
| Order 6     | Length 1 | Maximal Subgroups: 2   |
We find that $NL[2] \cong 3$ and has the given presentation: $S \lhd d = c|d - 3 >$.
Now, we use Magma code to find the quotient $q$ and the normal lattice of $q$.

```magma
H := NL[2];
q, ff := quo<G1|NL[2]>
q;
Permutation group q acting on a set of cardinality 40
Order = 6840 = 2^3 * 3^2 * 5 * 19

Normal subgroup lattice
-----------------------
---
[3] Order 3420 Length 1 Maximal Subgroups: 1
---
[2] Order 2 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:
```

Now, we will find the composition factors of $q$.

```magma
CompositionFactors(q);
G
| A(1, 19) = L(2, 19)
* | Cyclic(2)
1
```

We will now check if $q$ isomorphic to $PSL(2, 19) \times 2$ or not.

```magma
s := IsIsomorphic(q, DirectProduct(PSL(2, 19), CyclicGroup(2)));
s;
true
```

As a result, we can say that $q$ is isomorphic to $PSL(2, 19) \times 2$.

Now, we will write our presentation of $q$ by applying the FPGroup command in Magma.

It gives us the following presentation:

```magma
H = Group < a, b, c | a^2, b^3, c^2, (b^{-1} * a)^2, (a * c)^2, b * c * b^{-1} * c * b * c * b^{-1} * c * a * b^{-1} * c *
```
Now, we will check the relation between $\text{NL}[2]$ and $q$. Since $\text{NL}[2]$ is not the center of $G$, there is no normal subgroup of order $q$ which is 6840 so that is not direct product between $q$ and $\text{NL}[2]$. Then, we only have two options which are a semi direct product or mixed extension. So, we must determine the transversals of $\text{NL}[2]$.

\[
\begin{align*}
T &:= \text{Transversal}(G_1, \text{NL}[2]); \\
\text{ff}(T[2]) &\equiv q.1; \\
\text{true} \\
\text{ff}(T[3]) &\equiv q.2; \\
\text{true} \\
\text{ff}(T[4]) &\equiv q.3; \\
\text{true}
\end{align*}
\]

Now, we will label our generators of $\text{NL}[2]$ which is $A$. Also, we have these elements $d$ represents an element of $\text{NL}[2]$, and $a$, $b$, and $c$ represent elements of $q \cong PSL(2,19) \times 2$.

Where $J$, $I$, and $M$ represent $a$, $b$, and $c$ respectively.

\[
\begin{align*}
A &:= \text{NL}[2].2; \\
J &:= G_1!T[2]; \\
I &:= G_1!T[3]; \\
M &:= G_1!T[4];
\end{align*}
\]

Next, we will investigate the semi-direct product part of our extension, so we need to check the action of the generators of $q$ on the generators of $\text{NL}[2]$.

\[
\begin{align*}
\text{for } i \in [1..3] \text{ do if } A^J \equiv A^i \text{ then } i; \\
\text{end if; end for; } 2 \\
\text{for } i \in [1..3] \text{ do if } A^I \equiv A^i \text{ then } i; \\
\text{end if; end for; } 1 \\
\text{for } i \in [1..3] \text{ do if } A^M \equiv A^i \text{ then } i; \\
\text{end if; end for; } 2
\end{align*}
\]

So, we could get these relations $d^a = d^2$, $d^b = d$, and $d^c = d^2$ from the code above and add them to our presentation. Now, we have completed the semi-direct part of our presentation, so we will check a mixed extension part of our presentation. We have to check the presentation of $q$.  

FPGroup(q);
Finitely presented group on 3 generators
Relations
$.1^2 = Id($)
$.2^3 = Id($)
$.3^2 = Id($)
($.2^{-1} * $.1)^2 = Id($)

$.2^{-1} * $.3 * $.2 * $.3 * $.2 * $.3 * $.2^{-1} * $.3 *
$.3 * $.2 * $.3 * $.2 * $.3 * $.2^{-1} = Id($)

Recall that T[2]=.1, T[3]=.2, and T[4]=.3. We use the following Magma code to investigate which the order of elements of q changed. We found that.

for i in [1..3] do
if T[2]^2 eq A^i then i;
end if; end for;
3
for i in [1..3] do
if T[3]^3 eq A^i then i;
end if; end for;
3
for i in [1..3] do
if T[4]^2 eq A^i then i;
end if; end for;
3
for i in [1..3] do
if (T[3]^2 * T[2])^2 eq A^i then i;
end if; end for;
3
for i in [1..3] do
if (T[2] * T[4])^2 eq A^i then i;
end if; end for;
3
for i in [1..3] do

then i; end if; end for;

3
for i in [1..3] do
if (T[3]^{-1} \* T[4])^{10} eq A^i then i;
end if; end for;

3
for i in [1..3] do
end if; end for;

1
From above, we can see
\*
c * b^{-1} * c * b * c * b * c * b^{-1} * c * b * c * b^{-1} * c * b^{-1} * c * b^{-1} * c * b * c * b^{-1} * c * b * c * b^{-1} * c * b * c * b^{-1} is the only one that changed, where T[2]=a, T[3]=b, and T[4]=c.

We can check by using Magma.

c * b^{-1} * c * b * c * b * c * b^{-1} * c * b^{-1} * c * b^{-1} * c * b * a * c * c * b * b * c * b * b * c * b * b * c * b * b^{-1} eq d;
true

Now, we collect our generators of q and NL[2] with relations to our presentation, then we can check our presentation in Magma.

H<a, b, c, d> := Group<d, a, b, c |
a^{-2} , b^{-3} , c^{-2} , (b^{-1} * a)^{2} ,
(a * c)^{2} , b * c * b^{-1} * c * b * c * b^{-1} * c * a * b^{-1} * c * b * c * b^{-1} * c * b^{-1} * c * b^{-1} * c * b^{-1} * c * b * a * c * c * b^{-1} * c * b^{-1} * c * b * c * b * c * b^{-1} * c * b * c * b^{-1} * c * b^{-1} * c * b^{-1} * d, d^{-3}, d^{-a}=d^{-2}, d^{-b}=d, d^{-c}=d^{-2}>;
f1, H1, k1 := CosetAction(H, sub<H|Id(H)>);
s := IsIsomorphic(G1, H1);
s;
true

Therefore, $G$ is a mixed extension of 3 by $\text{PSL}(2, 19) \times 2$. $G \cong 3 : \text{PSL}(2, 19) \times 2$.

Chapter 6

Transitive Groups on 9 Letters

6.1 Transitive Group (9, 4)

We will write a progenitor on a transitive group on 9 letters. We investigate the number of transitive groups that exist on 9 letters by the following Magma code:

\texttt{NumberOfTransitiveGroups(9);}
\texttt{34}

Now, we will take the fourth group in the sequence.

\texttt{N:=TransitiveGroup(9,4);}
\texttt{S:=Sym(9);}
\texttt{xx:= S!(1, 2, 9) (3, 4, 5) (6, 7, 8);}
\texttt{yy:=S!(1, 2) (4, 5) (7, 8);}
\texttt{zz:=S!(1, 4, 7) (2, 5, 8) (3, 6, 9);}
\texttt{N:=sub<S|xx,yy,zz>;
#N;}
\texttt{for c,v,b,n,m,a,s in [0..10] do}
\texttt{G<x,y,z,t>:=Group<x,y,z,t|x^3,y^2,z^3,(x^-1*y)^2,(x,z),}
\texttt{y*z^-1*y*z,t^2,(t,x*y),(t,x*y*z^-1),}
\texttt{(y*t)^c,((y * z^-1)*t)^v,}
\texttt{(z*t)^b,(x*t)^n,}
\texttt{((x * z^-1)*t)^m,((x * z)*t)^a,((y * z)*t)^s>;
if #G gt 10 then c,v,b,n,m,a,s,#G;
end if;
end for;

Chapter 7

Monomial Progenitors

7.1 Definitions

Definition 7.1. We denote monomial progenitors as $p^N$.

Definition 7.2. Monomial Matrix is a square matrix that has exactly one non-zero entry in each row and each column. [HK06]

Definition 7.3. Monomial Representations [HK06] Let $G$ be a group. A monomial representation is a map $A \to GL(n : F)$, since $G$ is a homomorphism which provides that $A(x)$ and $A(y)$ are monomial matrices. Then, the monomial representation of $G$ is given by this formula:

$$A(x) = \begin{bmatrix}
\phi(t_1 x t_1^{-1}) & \phi(t_1 x t_2^{-1}) & \cdots & \phi(t_1 x t_n^{-1}) \\
\phi(t_2 x t_1^{-1}) & \phi(t_2 x t_2^{-1}) & \cdots & \phi(t_2 x t_n^{-1}) \\
\vdots & \vdots & \ddots & \vdots \\
\phi(t_n x t_1^{-1}) & \phi(t_n x t_2^{-1}) & \cdots & \phi(t_n x t_n^{-1})
\end{bmatrix}$$

Definition 7.4. Monomial Character A character $\phi$ of $G$ is monomial if $\phi$ is induced by a linear character of a subgroup $H$ (not necessarily proper) of $G$. [HK06]

Definition 7.5. Induced Character

Let $H \leq G$ and $\phi$ be a character of $G$. The formula for induced character is

$$\phi^G_\alpha = \frac{1}{n_a} \sum_{w \in C_a \cap H} \phi(w).$$
Where
\( \phi^G_\alpha \) is the value of \( \phi^G \) at each element of the class \( C_\alpha \).
\[ n = [G : H]. \]
\( h_\alpha \) is the number of elements in the class \( C_\alpha \) of \( G \).[HK06]

### 7.2 The Monomial Progenitors 11*2 :\( m \) \( D_5 \)

We will construct a monomial presentation of 11*2 :\( m \) \( D_5 \). Let \( G \) be generated by \( xx \) and \( yy \) where \( xx = (1, 2, 3, 4, 5) \) and \( yy = (1, 4)(2, 3) \). Also, Consider the subgroup \( H = \{ Id, (1, 4, 2, 5, 3), (1, 2, 3, 4, 5), (1, 5, 4, 3, 2), (1, 3, 5, 2, 4) \} \). To achieve a monomial presentation we must induce a linear character from a subgroup \( H \) of \( G \). We choose a subgroup with index matching the degree of an irreducible character of \( G \). Note, \( G \) has characters \( X.1, X.2, X.3, \) and \( X.4 \). We proceed using \( x.3 \) and look for a subgroup of order 5. So that \( [G : H] = \frac{10}{5} = 2 \) and \( [G : H] = 2 \). Since the index of the two groups is 2. If a matrix representation exists it will be represented by a \( 2 \times 2 \) matrices.

**Conjugacy Classes Representative of The Group \( G \) are:**

\( C_1 = Id(G) \)
\( C_2 = (1, 4)(2, 3) \)
\( C_3 = (1, 2, 3, 4, 5) \)
\( C_4 = (1, 3, 5, 2, 4) \)

**Conjugacy Classes Representative of The Group \( H \) are:**

\( D_1 = Id(H) \)
\( D_2 = (1, 4, 2, 5, 3) \)
\( D_3 = (1, 2, 3, 4, 5) \)
\( D_4 = (1, 5, 4, 3, 2) \)
\( D_5 = (1, 3, 5, 2, 4) \)
Consider the irreducible characters of $H$ and $G$ given below:

<table>
<thead>
<tr>
<th>Class</th>
<th>$C_1$</th>
<th>$C_2$</th>
<th>$C_3$</th>
<th>$C_4$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>1</td>
<td>5</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>Representative</td>
<td>Id($G$)</td>
<td>(1,4)(2,3)</td>
<td>(1,2,3,4,5)</td>
<td>(1,3,5,2,4)</td>
</tr>
<tr>
<td>$X.3$</td>
<td>2</td>
<td>0</td>
<td>$Z_1 = 14$</td>
<td>$Z_1 #2 = 7$</td>
</tr>
<tr>
<td>$X.4$</td>
<td>2</td>
<td>0</td>
<td>$Z_1 #2 = 7$</td>
<td>$Z_1 = 14$</td>
</tr>
</tbody>
</table>

### Table 7.1: Character Table of $G$

Before we move to next step, let us to explain how we can compute $Z_1$, and $Z_1 \#2$ of the character table of $G$. We will depend on Magma to do that.

$$Z_1 := \text{(CyclotomicField(5: Sparse := true)) !}$$

$$\begin{bmatrix} \text{RationalField()} & 0, 0, 1, 1 \end{bmatrix};$$

$$Z_1;$$

$$\zeta(5)_5^3 + \zeta(5)_5^2$$

$$\text{PrimitiveRoot}(11);$$

$$2^2;$$

$$|G|/|H|=10/5;$$

$$2^2;$$

$$\text{so, } \zeta(5)=4$$

$$Z_1=\zeta(5)_5^3 + \zeta(5)_5^2=4^3 \text{ mod } 11 + 4^2 \text{ mod } 11; 14$$

$$Z_1\#2=((\zeta(5)_5)\#2)^3 + ((\zeta(5)_5)\#2)^2$$

$$=4^6 \text{ mod } 11 + 4^4 \text{ mod } 11; 7$$

<table>
<thead>
<tr>
<th>Class</th>
<th>$D_1$</th>
<th>$D_2$</th>
<th>$D_3$</th>
<th>$D_4$</th>
<th>$D_5$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Representative</td>
<td>Id($H$)</td>
<td>(1,4,2,5,3)</td>
<td>(1,2,3,4,5)</td>
<td>(1,5,4,3,2)</td>
<td>(1,3,5,2,4)</td>
</tr>
<tr>
<td>$X.2$</td>
<td>1</td>
<td>$Z_1=4$</td>
<td>$Z_1#2 = 5$</td>
<td>$Z_1#3 = 9$</td>
<td>$Z_1#4 = 3$</td>
</tr>
</tbody>
</table>

### Table 7.2: Character Table of $H$

We can compute $Z_1$, $Z_1\#2$, $Z_1\#3$ and $Z_1\#4$ of the character table of $H$ by Magma program:

$$Z_1 := \text{(CyclotomicField(5: Sparse := true)) !}$$

$$\begin{bmatrix} \text{RationalField()} & 0, 1, 0, 0 \end{bmatrix};$$
73

$$Z_1;$$
$$\zeta(5)_5$$
$$Z_1=\zeta(5)_5=4$$
$$Z_1#2=(\zeta(5)_5)^2= 4^2 \mod 11; 5$$
$$Z_1#3=(\zeta(5)_5)^3= 4^3 \mod 11; 9$$
$$Z_1#4=(\zeta(5)_5)^4= 4^4 \mod 11; 3$$

7.2.1 The Induction Process

Now, we will induce the character \(X.2\) of \(H\) up to \(X.3\) of \(G\) to obtain the character of \(G\) by using the tables above and using our definition of induction as follows:

\[ \phi^G_{\alpha} = \frac{n}{\#_H} \sum_{w \in C_{\alpha} \cap H} \phi(w) \]

- \(\phi^G_1 = \frac{2}{n_1} \sum_{w \in C_1 \cap H} \phi(e) = 2\)
- \(\phi^G_2 = \frac{2}{n_2} \sum_{w \in C_2 \cap H} \phi(0) = 0\)
- \(\phi^G_3 = \frac{2}{n_3} \sum_{w \in C_3 \cap H} \phi((1, 2, 3, 4, 5)(1, 5, 4, 3, 2)) = \phi((1, 2, 3, 4, 5)) + \phi((1, 5, 4, 3, 2)) = Z_1 = 14\)
- \(\phi^G_4 = \frac{2}{n_4} \sum_{w \in C_4 \cap H} \phi((1, 3, 5, 2, 4)(1, 4, 2, 5, 3)) = \phi((1, 3, 5, 2, 4)) + \phi((1, 4, 2, 5, 3)) = 7.\)

Therefore, we have verified that \(\phi^G_H = 2, 0, 14,\) and \(7.\) So, the character \(X.2\) of \(H\) induces the character \(X.3\) of \(G\).

7.2.2 Verifying the Monomial Representation

We have a linear character of the subgroup \(H\) of index \(n\) in \(G\).
Thus, we will let \(G = Ht_1 \cup Ht_2 = He \cup H(1, 4)(2, 3).\) Where, \(t_1 = e\) and \(t_2 = (1, 4)(2, 3).\)
We are now in a position to give the monomial representation of the progenitor \(11^{*2} :_m D_5.\)

\[ A(xx) = \begin{bmatrix} \phi(t_1x^1) & \phi(t_1x^2) \\ \phi(t_2x^1) & \phi(t_2x^2) \end{bmatrix} \]
We now investigate the monomial representation has the following generators:

\[
A(xx) = \begin{bmatrix} 5 & 0 \\ 0 & 9 \end{bmatrix} \quad \text{and} \quad A(yy) = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}
\]

\[A[xx]: \text{Row 1}
\]
\[\bullet \phi(t_1x^{t_1^{-1}}) = \phi((1, 2, 3, 4, 5)) = 5
\]
\[\bullet \phi(t_1x^{t_2^{-1}}) = \phi(e(1, 2, 3, 4, 5)((1, 4)(2, 3))^{-1}) = 0
\]

\[A[xx]: \text{Row 2}
\]
\[\bullet \phi(t_2x^{t_1^{-1}}) = \phi((1, 4)(2, 3)(1, 2, 3, 4, 5)) = 0
\]
\[\bullet \phi(t_2x^{t_2^{-1}}) = \phi((1, 4)(2, 3)(1, 2, 3, 4, 5)((1, 4)(2, 3))^{-1}) = 9
\]

\[A[yy]: \text{Row 1}
\]
\[\bullet \phi(t_1y^{t_1^{-1}}) = \phi((1, 4)(2, 3)) = 0
\]
\[\bullet \phi(t_1y^{t_2^{-1}}) = \phi(e(1, 4)(2, 3)((1, 4)(2, 3))^{-1}) = 1
\]

\[A[yy]: \text{Row 2}
\]
\[\bullet \phi(t_2y^{t_1^{-1}}) = \phi((1, 4)(2, 3)(1, 4)(2, 3)) = 1
\]
\[\bullet \phi(t_2y^{t_2^{-1}}) = \phi((1, 4)(2, 3)(1, 4)(2, 3))^{-1}) = 0
\]

Therefore, we could verify the monomial representation has the following generators:

\[
A(xx) = \begin{bmatrix} 5 & 0 \\ 0 & 9 \end{bmatrix} \quad \text{and} \quad A(yy) = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}
\]

7.2.3 Construction a Permutation Representation:

We worked in \(\mathbb{Z}_{11}\) on matrices of degree \(2 \times 2\) which implies we are producing a \(11^*2 \cdot_m D_5\) progenitor permutation representation. We want to represent \(x\) and \(y\) as permutation to do so we see that \(a_{i,j} = n\) if the automorphism takes \(t_i \implies t_j^n\).

There are \(11^*2\) is a free product of 2 cyclic groups of order 11. Thus, we will construct a table with 2 \(t'_i\)s of order 11 labeled from 1.....20.
\[ A(xx) = \begin{bmatrix} 5 & 0 \\ 0 & 9 \end{bmatrix} \] (where \( a_{11} = 5 \), and \( a_{22} = 9 \)). Therefore, \( t_1 \rightarrow t_1^5 \), and \( t_2 \rightarrow t_2^9 \).

\[ A(yy) = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \] (where \( a_{12} = 1 \), and \( a_{21} = 1 \)). Therefore, \( t_1 \rightarrow t_2 \), and \( t_2 \rightarrow t_1 \).

| t_2^0 | t_1^{10} | t_2^{10} |
| t_1^4 | t_2^6 | t_2^2 |
| 8  | 11 | 4  |

| t_2^0 | t_1^{10} | t_2^{10} |
| t_1^4 | t_2^6 | t_1^{10} |
| 17 | 20 | 19 |
Therefore, consider the automorphism of xx and automorphism of yy as follows:

\[ A(xx) = (1, 9, 5, 7, 17)(2, 18, 8, 6, 10)(3, 19, 11, 15, 13)(4, 14, 16, 12, 20). \]

\[ A(yy) = (1, 2)(3, 4)(5, 6)(7, 8)(9, 10)(11, 12)(13, 14)(15, 16)(17, 18)(19, 20). \]

### 7.2.4 Creating a Representation of the Progenitor:

Now, we need to find a presentation for our progenitor.

We must choose at \( t \) to normalizer from our two choices \( \langle t_1 \rangle \ast \langle t_2 \rangle \).

Let \( t \sim t_1 \) and we must find permutations which normalize \( \langle t_1 \rangle \) fix the following set

\[ \{ t_1, t_1^2, t_1^3, t_1^4, t_1^5, t_1^6, t_1^7, t_1^8, t_1^{10}, t_2, t_2^2, t_2^3, t_2^4, t_2^5, t_2^6, t_2^7, t_2^8, t_2^{10}\}. \]

Therefore, we need to compute the set stabilizer of the set \( \{ t_1, t_1^2, t_1^3, t_1^4, t_1^5, t_1^6, t_1^7, t_1^8, t_1^{10}\} \)

\[ = \{1, 3, 5, 7, 9, 11, 13, 15, 17, 19\}. \]

\[
\begin{align*}
S &= \text{Sym}(20); \\
xx &= G.1; \\
yy &= G.2; \\
xx &= S!(1, 9, 5, 7, 17)(2, 18, 8, 6, 10)(3, 19, 11, 15, 13)(4, 14, 16, 12, 20); \\
yy &= S!(1, 2)(3, 4)(5, 6)(7, 8)(9, 10)(11, 12)(13, 14)(15, 16)(17, 18)(19, 20); \\
Nm &= \text{Sub}\langle S | xx, yy\rangle; \\
Finitely presented group on 2 generators \\
Relations
\end{align*}
\]

\[ $.2^2 = \text{Id}($) \]

\[ ($^1 - 1 * .2)^2 = \text{Id}($) \]

\[ $.1^5 = \text{Id}($) \]

Now, we will convert \( \text{FPGroup}(N) \) to our presentation.

\[ G < x, y > := \text{Group} < x, y | y^5, (x-1 * y)^2, x^{-5} >; \]

Next, we will find the stabilizer of \( < t_1 > \).

\[
\begin{align*}
\text{Stabilizer}$(Nm, \{1, 3, 5, 7, 9, 11, 13, 15, 17, 19\}); \\
(1, 9, 5, 7, 17)(2, 18, 8, 6, 10)(3, 19, 11, 15, 13)(4, 14, 16, 12, 20)
\end{align*}
\]
Thus, we discover the stabilizer of $< t_1 >$ in $D_5$ is generated by one element which we will label $A$.

$A=(1, 9, 5, 7, 17)(2, 18, 8, 6, 10)(3, 19, 11, 15, 13)(4, 14, 16, 12, 20)$. For a presentation we must convert this permutation into words which we find to be:

$(1, 9, 5, 7, 17)(2, 18, 8, 6, 10)(3, 19, 11, 15, 13)(4, 14, 16, 12, 20)=x$.

As a result, we find that $A$ sends 1 to 9 or $t_1$ to $t_5$. We will add this $t^x = t^5$ to our presentation. Therefore, we obtain the monomial progenitor as follows:

$$11^{*2} : D_5 =< x, y, t|y^2, (x^{-1} * y)^2, x^{-5}, t^{11}, t^x = t^5, (t, t^y) >.$$ 

7.2.5 The Monomial Progenitors $59^{*2} : m D_{29}$

We first establish a monomial presentation of $59^{*2} : m D_{29}$.

$G$ has order 58 and it is generated by $xx$ and $yy$ where $xx=(1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29)$

We must induce a linear character from a subgroup $H$ of $G$ to create a monomial presentation. To insure we get an irreducible character, we must choose a subgroup with index matching the degree of an irreducible character of $G$. The characters of $G$ are $\chi_1, \chi_2, \chi_3, \chi_4, \chi_5, \chi_6, \chi_7, \chi_8, \chi_9, \chi_{10}, \chi_{11}, \chi_{12}, \chi_{13}, \chi_{14}, \chi_{15}, \chi_{16}$.

We have a subgroup $H$ of order 29, where

$H = \{1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3\}$. So that $\frac{|G|}{|H|} = \frac{58}{29} = 2$ and $[G : H] = 2$. Since the index of the group is 2. If a matrix representation exists, it will be represented by a $2 \times 2$ matrices.

Conjugacy Classes Representative of The Group $G$ are:

$C_1 = Id(G)$

(23, 27)(24, 26)$

$C_3 = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29)$
$C_4 = (1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28)$

$C_5 = (1, 4, 7, 10, 13, 16, 19, 22, 25, 28, 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, 3, 6, 9, 12, 15, 18, 21, 24, 27)$

$C_6 = (1, 5, 9, 13, 17, 21, 25, 29, 4, 8, 12, 16, 20, 24, 28, 3, 7, 11, 15, 19, 23, 27, 2, 6, 10, 14, 18, 22, 26)$

$C_7 = (1, 6, 11, 16, 21, 26, 2, 7, 12, 17, 22, 27, 3, 8, 13, 18, 23, 28, 4, 9, 14, 19, 24, 29, 5, 10, 15, 20, 25)$

$C_8 = (1, 7, 13, 19, 25, 2, 8, 14, 20, 26, 3, 9, 15, 21, 27, 4, 10, 16, 22, 28, 5, 11, 17, 23, 29, 6, 12, 18, 24)$

$C_9 = (1, 8, 15, 22, 29, 7, 14, 21, 28, 6, 13, 20, 27, 5, 12, 19, 26, 4, 11, 18, 25, 3, 10, 17, 24, 2, 9, 16, 23)$

$C_{10} = (1, 9, 17, 25, 4, 12, 20, 28, 7, 15, 23, 2, 10, 18, 26, 5, 13, 21, 29, 8, 16, 24, 3, 11, 19, 27, 6, 14, 22)$

$C_{11} = (1, 10, 19, 28, 8, 17, 26, 6, 15, 24, 4, 13, 22, 2, 11, 20, 29, 9, 18, 27, 7, 16, 25, 5, 14, 23, 3, 12, 21)$

$C_{12} = (1, 11, 21, 2, 12, 22, 3, 13, 23, 4, 14, 24, 5, 15, 25, 6, 16, 26, 7, 17, 27, 8, 18, 28, 9, 19, 29, 10, 20)$

$C_{13} = (1, 12, 23, 5, 16, 27, 9, 20, 2, 13, 24, 6, 17, 28, 10, 21, 3, 14, 25, 7, 18, 29, 11, 22, 4, 15, 26, 8, 19)$

$C_{14} = (1, 13, 25, 8, 20, 3, 15, 27, 10, 22, 5, 17, 29, 12, 24, 7, 19, 2, 14, 26, 9, 21, 4, 16, 28, 11, 23, 6, 18)$

$C_{15} = (1, 14, 27, 11, 24, 8, 21, 5, 18, 2, 15, 28, 12, 25, 9, 22, 6, 19, 3, 16, 29, 13, 26, 10, 23, 7, 20, 4, 17)$

$C_{16} = (1, 15, 29, 14, 28, 13, 27, 12, 26, 11, 25, 10, 24, 9, 23, 8, 22, 7, 21, 6, 20, 5, 19, 4, 18, 3, 17, 2, 16)$

**Conjugacy Classes Representative of The Group H are:**

$D_1 = Id(H)$

$D_2 = (1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3)$

$D_3 = (1, 26, 22, 18, 14, 10, 6, 2, 27, 23, 19, 15, 11, 7, 3, 28, 24, 20, 16, 12, 8, 4, 29, 25, 21, 17,$
13, 9, 5)

\[ D_1 = (1, 24, 18, 12, 6, 29, 23, 17, 11, 5, 28, 22, 16, 10, 4, 27, 21, 15, 9, 3, 26, 20, 14, 8, 2, 25, 19, 13, 7) \]

\[ D_5 = (1, 22, 14, 6, 27, 19, 11, 3, 24, 16, 8, 29, 21, 13, 5, 26, 18, 10, 2, 23, 15, 7, 28, 20, 12, 4, 25, 17, 9) \]

\[ D_6 = (1, 20, 10, 29, 19, 9, 28, 18, 8, 27, 17, 7, 26, 16, 6, 25, 15, 5, 24, 14, 4, 23, 13, 3, 22, 12, 2, 21, 11) \]

\[ D_7 = (1, 18, 6, 23, 11, 28, 16, 4, 21, 9, 26, 14, 2, 19, 7, 24, 12, 29, 17, 5, 22, 10, 27, 15, 3, 20, 8, 25, 13) \]

\[ D_8 = (1, 16, 2, 17, 3, 18, 4, 19, 5, 20, 6, 21, 7, 22, 8, 23, 9, 24, 10, 25, 11, 26, 12, 27, 13, 28, 14, 29, 15) \]

\[ D_9 = (1, 14, 27, 11, 24, 8, 21, 5, 18, 2, 15, 28, 12, 25, 9, 22, 6, 19, 3, 16, 29, 13, 26, 10, 23, 7, 20, 4, 17) \]

\[ D_{10} = (1, 12, 23, 5, 16, 27, 9, 20, 2, 13, 24, 6, 17, 28, 10, 21, 3, 14, 25, 7, 18, 29, 11, 22, 4, 15, 26, 8, 19) \]

\[ D_{11} = (1, 10, 19, 28, 8, 17, 26, 6, 15, 24, 4, 13, 22, 2, 11, 20, 29, 9, 18, 27, 7, 16, 25, 5, 14, 23, 3, 12, 21) \]

\[ D_{12} = (1, 8, 15, 22, 29, 7, 14, 21, 28, 6, 13, 20, 27, 5, 12, 19, 26, 4, 11, 18, 25, 3, 10, 17, 24, 2, 9, 16, 23) \]

\[ D_{13} = (1, 6, 11, 16, 21, 26, 2, 7, 12, 17, 22, 27, 3, 8, 13, 18, 23, 28, 4, 9, 14, 19, 24, 29, 5, 10, 15, 20, 25) \]

\[ D_{14} = (1, 4, 7, 10, 13, 16, 19, 22, 25, 28, 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, 3, 6, 9, 12, 15, 18, 21, 24, 27) \]

\[ D_{15} = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29) \]

\[ D_{16} = (1, 29, 28, 27, 26, 25, 24, 23, 22, 21, 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2) \]

\[ D_{17} = (1, 27, 24, 21, 18, 15, 12, 9, 6, 3, 29, 26, 23, 20, 17, 14, 11, 8, 5, 2, 28, 25, 22, 19, 16, 13, 10, 7, 4) \]

\[ D_{18} = (1, 25, 20, 15, 10, 5, 29, 24, 19, 14, 9, 4, 28, 23, 18, 13, 8, 3, 27, 22, 17, 12, 7, 2, 26, 21, 16, 11, 6) \]

\[ D_{19} = (1, 23, 16, 9, 2, 24, 17, 10, 3, 25, 18, 11, 4, 26, 19, 12, 5, 27, 20, 13, 6, 28, 21, 14, 7, 29, \]
7.2.6 The Induction Process

Now, we will induce the character $\chi_2$ of $H$ up to $\chi_5$ of $G$ to obtain the character of $G$ by using the tables $\chi_5$ of $G$ and $\chi_2$ of $H$ using our definition of induction as follows:

$$\phi^G_\alpha = \frac{n}{h_o} \sum_{w \in C_\alpha \cap H} \phi(w)$$

$$\phi^G_1 = \frac{2}{h_1} \sum_{w \in C_1 \cap H} \phi(e) = 2.$$ 

$$\phi^G_2 = \frac{2}{h_2} \sum_{w \in C_2 \cap H} \phi(0) = 0.$$
\[\phi_{10}^G = \sum_{c_{10}=Z} \phi(1, 9, 17, 25, 4, 12, 20, 28, 7, 15, 23, 2, 10, 18, 26, 5, 13, 21, 29, 8, 16, 24, 3, 11, 19, 27, 6, 14, 22) + \phi(1, 22, 14, 6, 27, 19, 11, 3, 24, 16, 8, 29, 21, 13, 5, 26, 18, 10, 2, 23, 15, 7, 28, 20, 12, 4, 25, 17, 9) = Z1\#25 + Z1\#4 = 3 + 20 = 23 =\]

\[\phi_{9}^G = \sum_{c_{9}=Z} \phi(1, 8, 15, 22, 29, 7, 14, 21, 28, 6, 13, 20, 27, 5, 12, 19, 26, 4, 11, 18, 25, 3, 10, 17, 24, 2, 9, 16, 23) + \phi(1, 23, 16, 9, 2, 24, 17, 10, 3, 25, 18, 11, 4, 26, 19, 12, 5, 27, 20, 13, 6, 28, 21, 14, 7, 29, 22, 15, 8) = Z1\#11 + Z1\#18 = 53 + 49 = 102 = Z1\#9.\]

\[\phi_{8}^G = \sum_{c_{8}=Z} \phi(1, 7, 13, 19, 25, 2, 8, 14, 20, 26, 3, 9, 15, 21, 27, 4, 10, 16, 22, 28, 5, 11, 17, 23, 29, 6, 12, 18, 24) + \phi(1, 24, 18, 12, 6, 29, 23, 17, 11, 5, 28, 22, 16, 10, 4, 27, 21, 15, 9, 3, 26, 20, 14, 8, 2, 25, 19, 13, 7) = Z1\#26 + Z1\#3 = 12 + 5 = 17 = Z1\#13.\]

\[\phi_{7}^G = \sum_{c_{7}=Z} \phi(1, 6, 11, 16, 21, 26, 2, 7, 12, 17, 22, 27, 3, 8, 13, 18, 23, 28, 4, 9, 14, 19, 24, 29, 5, 10, 15, 20, 25) + \phi(1, 25, 20, 15, 10, 5, 29, 24, 19, 14, 9, 4, 28, 23, 18, 13, 8, 3, 27, 22, 17, 12, 7, 2, 26, 21, 16, 11, 6) = Z1\#12 + Z1\#17 = 35 + 27 = 62 = Z1\#6.\]

\[\phi_{4}^G = \sum_{c_{4}=Z} \phi(1, 23, 25, 27, 29, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28) + \phi(1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3) = Z1\#28 + 1 = 15 + 4 = 19 = Z1\#14.\]

\[\phi_{3}^G = \sum_{c_{3}=Z} \phi(1, 23, 25, 27, 29, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28) + \phi(1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3) = Z1\#28 + 1 = 15 + 4 = 19 = Z1\#14.\]

\[\phi_{2}^G = \sum_{c_{2}=Z} \phi(1, 23, 25, 27, 29, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28) + \phi(1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3) = Z1\#28 + 1 = 15 + 4 = 19 = Z1\#14.\]

\[\phi_{1}^G = \sum_{c_{1}=Z} \phi(1, 23, 25, 27, 29, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28) + \phi(1, 28, 26, 24, 22, 20, 18, 16, 14, 12, 10, 8, 6, 4, 2, 29, 27, 25, 23, 21, 19, 17, 15, 13, 11, 9, 7, 5, 3) = Z1\#28 + 1 = 15 + 4 = 19 = Z1\#14.\]
$Z1\#2.$

$$
\phi_{11}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 10, 19, 28, 8, 17, 26, 6, 15, 24, 4, 13, 22, 2, 11, 20, 29, 9, 18, 27, 7, 16, 25, 5, 14, 23, 3, 12, 21) + \phi(1, 21, 12, 3, 23, 14, 5, 25, 16, 7, 27, 18, 9, 29, 20, 11, 2, 22, 13, 4, 24, 15, 6, 26, 17, 8, 28, 19, 10) = Z1\#10 + Z1\#19 = 28 + 19 = 47 = Z1\#5. 
$$

$$
\phi_{12}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 11, 21, 2, 12, 22, 3, 13, 23, 4, 14, 24, 5, 15, 25, 6, 16, 26, 7, 17, 27, 8, 18, 28, 9, 19, 29, 10, 20) + \phi(1, 20, 10, 29, 19, 9, 28, 18, 8, 27, 17, 7, 26, 16, 6, 25, 15, 5, 24, 14, 4, 23, 13, 3, 22, 12, 2, 21, 11) = Z1\#24 + Z1\#5 = 45 + 21 = 66 = Z1\#12. 
$$

$$
\phi_{13}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 12, 23, 5, 16, 27, 9, 20, 2, 13, 24, 6, 17, 28, 10, 21, 3, 14, 25, 7, 18, 29, 11, 22, 4, 15, 26, 8, 19) + \phi(1, 19, 8, 26, 15, 4, 22, 11, 29, 18, 7, 25, 14, 3, 21, 10, 28, 17, 6, 24, 13, 2, 20, 9, 27, 16, 5, 23, 12) = Z1\#9 + Z1\#20 = 7 + 17 = 24 = Z1\#10. 
$$

$$
\phi_{14}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 13, 25, 8, 20, 3, 15, 27, 10, 22, 5, 17, 29, 12, 24, 7, 19, 2, 14, 26, 9, 21, 4, 16, 28, 11, 23, 6, 18) + \phi(1, 18, 6, 23, 11, 28, 16, 4, 21, 9, 26, 14, 2, 19, 7, 24, 12, 29, 17, 5, 22, 10, 27, 15, 3, 20, 8, 25, 13) = Z1\#23 + Z1\#6 = 26 + 25 = 51 = Z1\#3. 
$$

$$
\phi_{15}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 14, 27, 11, 24, 8, 21, 5, 18, 2, 15, 28, 12, 25, 9, 22, 6, 19, 3, 16, 29, 13, 26, 10, 23, 7, 20, 4, 17) + \phi(1, 17, 4, 20, 7, 23, 10, 26, 13, 29, 16, 3, 19, 6, 22, 9, 25, 12, 28, 15, 2, 18, 5, 21, 8, 24, 11, 27, 14) = Z1\#8 + Z1\#21 = 46 + 9 = 55 = Z1\#4. 
$$

$$
\phi_{16}^G = \sum_{h_{13}=\mathbb{Z}} \phi(1, 15, 29, 14, 28, 13, 27, 12, 26, 11, 25, 10, 24, 9, 23, 8, 22, 7, 21, 6, 20, 5, 19, 4, 18, 3, 17, 2, 16) + \phi(1, 16, 2, 17, 3, 18, 4, 19, 5, 20, 6, 21, 7, 22, 8, 23, 9, 24, 10, 25, 11, 26, 12, 27, 13, 28, 14, 29, 15) = Z1\#22 + Z1\#7 = 36 + 41 = 77 = Z1\#11. 
$$

Therefore, we have verified that $\phi^G_H = 2, 0$, $Z1\#7, Z1\#14, Z1\#8, Z1, Z1\#6, Z1\#13, Z1\#9, Z1\#2, Z1\#5, Z1\#12, Z1\#10, Z1\#3, Z1\#4$, and $Z1\#11$.

So, $\chi.2$ of $H$ induces $\chi.5$ of $G$.

7.2.7 Verifying the Monomial Representation

We have a linear character of the subgroup $H$ of index $n$ in $G$. Thus, we will let $G = Ht_1 \cup Ht_2$, Where, $t_1 = e$ and $t_2 = (1,28)(2,27)(3,26)(4,25)(5,24)(6,23)(7,22)(8,21)(9,20)(10,19)(11,18)(12,17)(13,16)(14,15)$. We are now in position to give the monomial representation of the progenitor $59^{*2} : m D_{29}$.

$$A(xx) = \begin{bmatrix} \phi(t_1 x t_1^{-1}) & \phi(t_1 x t_2^{-1}) \\ \phi(t_2 x t_1^{-1}) & \phi(t_2 x t_2^{-1}) \end{bmatrix}$$

We now investigate the monomial representation has the following generators:

$$A(xx) = \begin{bmatrix} 29 & 0 \\ 0 & 57 \end{bmatrix} \quad \text{and} \quad A(yy) = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

**A[xx]: Row 1**

- $\phi(t_1 x t_1^{-1}) = \phi((1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29)) = 29.$

- $\phi(t_2 x t_2^{-1}) = \phi((1, 27, 26)(3, 25)(4, 24)(5, 23)(6, 22)(7, 21)(8, 20)(9, 19)(10, 18)(11, 17)(12, 16)(13, 15)(28, 29)) = 0.$

**A[xx]: Row 2**

- $\phi(t_2 x t_1^{-1}) = \phi((1, 29)(2, 28)(3, 27)(4, 26)(5, 25)(6, 24)(7, 23)(8, 22)(9, 21)(10, 20)(11, 19)(12, 18)(13, 17)(14, 16)) = 0.$
\[ \phi(t_2 t_2^{-1}) = \phi((1, 28)(2, 27)(3, 26)(4, 25)(5, 24)(6, 23)(7, 22)(8, 21)(9, 20)(10, 19)(11, 18)
(12, 17)(13, 16)(14, 15)(1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,
(11, 18)(12, 17)(13, 16)(14, 15))^{-1} = 57. \]
\[ \Rightarrow A(xx) = \begin{bmatrix} 29 & 0 \\ 0 & 57 \end{bmatrix} \]

A[yy]: Row 1
\[ \phi(t_1 y t_1^{-1}) = \phi((1, 28)(2, 27)(3, 26)(4, 25)(5, 24)(6, 23)(7, 22)(8, 21)(9, 20)(10, 19)
(11, 18)(12, 17)(13, 16)(14, 15)) = 0. \]
\[ \bullet \phi(t_1 y t_1^{-1}) = \phi(e) = 1. \]

A[yy]: Row 2
\[ \bullet \phi(t_2 y t_2^{-1}) = \phi(e) = 1. \]
\[ \bullet \phi(t_2 y t_2^{-1}) = \phi((1, 28)(2, 27)(3, 26)(4, 25)(5, 24)(6, 23)(7, 22)(8, 21)(9, 20)
(10, 19)(11, 18)(12, 17)(13, 16)(14, 15)) = 0. \]
\[ \Rightarrow A(yy) = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \]

7.2.8 Construction a Permutation Representation:

We worked in \( \mathbb{Z}_{59} \) on matrices of degree \( 2 \times 2 \) which implies we are producing a \( 59 \times 2 : D_{29} \) progenitor permutation representation. We want to represent \( x \) and \( y \) as permutation to do so we see that \( a_{i,j} = n \) if the automorphism takes \( t_i \mapsto t_j^n \). There are \( 59 \times 2 \) is a free product of 2 cyclic groups of order 59. Thus, we will construct a table with \( 2 t_i's \) of order 59 labeled from 1....116.

\[ A(xx) = \begin{bmatrix} 29 & 0 \\ 0 & 57 \end{bmatrix} \]
(Where \( a_{11}=29 \), and \( a_{22}=57 \)). Therefore, \( t_1 \mapsto t_1^{29}, \) and \( t_2 \mapsto t_2^{57} \).
Table 7.7: Automorphism of $A(x)$

|   | $t_1$ | $t_2$ | $t_1^2$ | $t_2^2$ | $t_1^3$ | $t_2^3$ | $t_1^4$ | $t_2^4$ | $t_1^5$ | $t_2^5$ | $t_1^6$ | $t_2^6$ | $t_1^7$ | $t_2^7$ | $t_1^8$ | $t_2^8$ | $t_1^9$ | $t_2^9$ | $t_1^{10}$ | $t_2^{10}$ | $t_1^{11}$ | $t_2^{11}$ | $t_1^{12}$ | $t_2^{12}$ | $t_1^{13}$ | $t_2^{13}$ | $t_1^{14}$ | $t_2^{14}$ | $t_1^{15}$ |
| 1 | $t_2^{29}$ | $t_2^{57}$ | $t_1^{58}$ | $t_2^{55}$ | $t_2^{28}$ | $t_2^{53}$ | $t_1^{57}$ | $t_1^{51}$ | $t_2^{27}$ | $t_2^{49}$ | $t_1^{56}$ | $t_2^{47}$ | $t_1^{26}$ | $t_2^{45}$ |

t_2^63 & t_1^63 & t_2^63 & t_3^63 & t_4^63 & t_5^63 & t_6^63 & t_7^63 & t_8^63 & t_{10}^63 & t_{11}^63 & t_{12}^63 & t_{13}^63 & t_{14}^63 & t_{15}^63 & t_{16}^63 & t_{17}^63 \\
\hline
64 & 63 & 66 & 65 & 68 & 67 & 70 & 69 & 72 & 71 & 74 & 73 & 76 & 75 & 78 & 75 & 78
\end{array}
\]
A(yy) = (1, 2)(3, 4)(5, 6)(7, 8)(9, 10)(11, 12)(13, 14)(15, 16)(17, 18)(19, 20)
(79, 80)(81, 82)(83, 84)(85, 86)(87, 88)(89, 90)(91, 92)(93, 94)(95, 96)
(113, 114)(115, 116).

Now, we can create permutations by using our labels for each automorphism.
We will Consider t1 by element 1 from the table.
This produces the permutation (1, 57, 29, 43, 95, 69, 23, 105, 5, 55, 89, 13, 51, 91, 71, 81,
17, 49, 33, 41, 37, 39, 97, 9, 53, 31, 101, 7, 113) if we follow each element and its corresponding
automorphism number labeling. We can construct our automorphism by repeating the
process for x, and y we produce the following permutations:
A(xx) = (1, 57, 29, 43, 95, 69, 23, 105, 5, 55, 89, 13, 51, 91, 71, 81,
17, 49, 33, 41, 37, 39, 97, 9, 53, 31, 101, 7, 113).
So, we have completed the process of construction a permutation representation from our matrices.

### 7.2.9 Creating a Representation of the Progenitor:

Now, we need to find a presentation for our progenitor. We must choose at to normalize from our two choices $\langle t_1 \rangle^* \langle t_2 \rangle$. Let $t \sim t_1$ and we must find permutations which normalize $\langle t_1 \rangle$ fix the following set

$$\{t_1, t_2, t_3, ..., t_{116}\}.$$

Therefore, we need to compute the set stabilizer of the set

$$\{t_1, t_2, t_3, ..., t_{116}\}.$$
FPGroup(N);
Finitely presented group on 2 generators
Relations
$.2^2 = \text{Id}(\$)
($.1^{-1} * $.2)^2 = \text{Id}(\$)
$.1^{-29} = \text{Id}(\$)
So we will convert FPGroup(N) to our presentation where .2=y and .1=x. Also, we discover the Stabilizer of \( < t_1 > \) in \( D_{29} \) is generated by one element which we will label A.

A=(1, 95, 5, 51, 17, 37, 53, 113, 43, 105, 13, 81, 41, 9, 7, 29, 23, 89, 71, 33, 97, 101, 57, 69, 55, 91, 49, 39, 31)(2, 32, 40, 50, 92, 56, 70, 58, 102, 98, 34, 72, 90, 24, 30, 8, 10, 42, 82, 14, 106, 44, 114, 54, 38, 18, 52, 6, 96)
For a presentation we must convert these permutations into words which we find to be:
\( x^4=(1, 95, 5, 51, 17, 37, 53, 113, 43, 105, 13, 81, 41, 9, 7, 29, 23, 89, 71, 33, 97, 101, 57, 69, 55, 91, 49, 39, 31)(2, 32, 40, 50, 92, 56, 70, 58, 102, 98, 34, 72, 90, 24, 30, 8, 10, 42, 82, 14, 106, 44, 114, 54, 38, 18, 52, 6, 96)
As a result, we find that A sends 1 to 95 or \( t_1 \) to \( t_1^{48} \). We will add this \( t^4 = t^{48} \) to our presentation. Therefore, we obtain the monomial progenitor as follows:

\( 59^2 :_m D_{29} = < x, y, t | y^2, (x^{-1} * y)^2, x^{-29}, t^{59}, t^4 = t^{48}, (t, t^y) >. \)
Chapter 8

Double Coset Enumeration

8.1 Definition for Double Coset Enumeration

Definition 8.1. Let $G$ be a group and $H$ and $K$ be subgroups of $G$. A double coset of $H$ and $K$ of the form $HgK = \{Hgk | k \in K\}$ is determined by $g \in G$. [Rot95]

Definition 8.2. Let $G$ be a group and $S \subseteq G$. For $t \in G$, a right coset of $S$ in $G$ is the subset of $G$ such that $St = \{st : s \in G\}$. We say $t$ is a representative of the coset $St$. [Rot95]

Definition 8.3. Let $G$ be a group. The index of $H \leq G$, denoted $[G : H]$, is the number of right cosets of $H$ in $G$. [Rot95]

Definition 8.4. Let $N$ be a group. The point stabilizer of $w$ in $N$ is given by:

$$N^w = \{n \in N | w^n = w\},$$

where $w$ is a word in the $t_i$’s. [Rot95]

Definition 8.5. Let $N$ be a group. The coset stabiliser of $Nw$ in $N$ is given by:

$$N^{(w)} = \{n \in N | Nw^n = Nw\},$$

where $w$ is a word of the $t_i$’s. [Rot95]

Theorem 8.6. The Number of single cosets in $NwN$ The above definition gives, $N^w = \{n \in N | Nwn = Nw\} = \{n \in N | (Nw)^n = Nw\} = N \cap N^w$. The number of single cosets in $NwN$ is given by $[N : N^{(w)}]$. [Rot95]

Definition 8.7. Let $G$ be a group and $X$ be a $G$-set. For $x \in X$, the set $x^G = \{x^g | g \in G\}$ is a $G$-Orbit. [Rot95]
Definition 8.8. Let $G$ be a group and $X$ be a $G$-set. $X$ is transitive if for all $x, y \in X$ there exists a $g \in G$ such that $y = gx$. [Rot95]

Definition 8.9. Let $a \in G$, where $G$ is a group. The conjugacy class of $a$ is given by $a^G = \{a^g | g \in G\} = \{g^{-1}ag | g \in G\}$. [Rot95]

8.2 Double Coset Enumeration of $2^4 : S_3 \times C_2$ over $(2 \times 4 : 2)$

Consider the group $G = \frac{2^{8s}(2s \times 4s)}{(2s)(wxyt)} = (2^4 : S_3 \times C_2)$ where $N = (2 \times 4 : 2)$.

A symmetric presentation of $G$ is $G = \text{Group} < w, x, y, z, t | w^2, x^2, y^4, z^2, (w * y^{-1})^2, x * y^{-1} * x * y, y^{-2} * z, w * x * w * x * z, t^2, (t, w), (x * t)^3, (w * x * y * t)^3 >$.

Where $w \sim (2, 5)(3, 7), x \sim (1, 2)(3, 6)(4, 5)(7, 8), y \sim (1, 3, 4, 7)(2, 6, 5, 8)$ and $z \sim (1, 4)(2, 5)(3, 7)(6, 8)$

First, we are going to expand our relations.

The first relation is

\[
(x * t)^3 = e
\]
\[
(x * t_1)^3 = e \text{ since } t \sim t_1
\]
\[
x^3 * t_1^x * t_1^y * t_1 = e
\]
\[
x^3 * t_1^y * t_2 * t_1 = e
\]
\[
x^3 * t_1 * t_2 = t_1
\]

So, we have $t_1 t_2 \sim t_1$.

The second relation is

\[
(w * x * y * t)^3 = e
\]
\[
(w * x * y * t_1)^3 = e
\]
\[
(w * x * y)^3 * t_1^{(w * x * y)^2} * t_1^{w * x * y} * t_1 = e
\]
\[
(w * x * y)^3 * t_4 * t_6 * t_1 = e
\]
\[
(w * x * y)^3 * t_4 * t_6 = t_1
\]

So, we have $t_4 t_6 \sim t_1$. 

Moreover, if we conjugate the previous relations by all elements in

\[ N = \{ e, (2, 5)(3, 7), (1, 7)(2, 6)(3, 4)(5, 8), (1, 6, 4, 8)(2, 3, 5, 7), \\
(1, 7, 4, 3)(2, 8, 5, 6), (1, 5)(2, 4)(3, 8)(6, 7), \\
(1, 8, 4, 6)(2, 3, 5, 7), (1, 5, 4, 2)(3, 6, 7, 8), (1, 2, 4, 5)(3, 8, 7, 6), \\
(1, 6, 4, 8)(2, 7, 5, 3), (1, 4)(2, 5)(3, 7)(6, 8), (1, 3, 4, 7)(2, 6, 5, 8), \\
(1, 8, 4, 6)(2, 7, 5, 3), (1, 2)(3, 6)(4, 5)(7, 8), (1, 3)(2, 8)(4, 7)(5, 6), (1, 4)(6, 8) \}. \]

So, we get theses relations by conjugate the first relation by all elements of \( N \)

\[
12 \cong 1, 15 \cong 1, 76 \cong 7, 63 \cong 6, 78 \cong 7, 54 \cong 5, 83 \cong 8, 51 \cong 5, 24 \cong 2, 67 \cong 6, 45 \cong 4, \\
36 \cong 3, 87 \cong 8, 21 \cong 2, 38 \cong 3, 42 \cong 4.
\]

Also, we will get theses relations by conjugate the second relation by all elements of \( N \)

\[
46 \cong 1, 32 \cong 7, 84 \cong 6, 27 \cong 5, 61 \cong 8, 53 \cong 2, 18 \cong 4, 75 \cong 3.
\]

We have to find the total number of cosets of \( N \) in \( G \). This is the index of \( N \) in \( G \). The index will be the order of \( G \) divided by the order of \( N \).

\[
\frac{|G|}{|N|} = \frac{192}{16} = 12 \text{ single cosets}
\]

and we have 4 Double cosets.

\#DoubleCosets(G, sub<G|x,y>, sub<G|w,x,y,z>);

4

Double Cosets

Multiple Coset \([\ast]\) : We start with the multiple coset \( NeN \), where \( e \) is the word of length zero denote by \([\ast]\). We have \( NeN = \{ n \in N | Nen \} = \{ Ne \} = \{ N \} \). So, the multiple coset \( NeN \) consist of single coset \( N \). Thus, the number of right cosets in \([\ast]\) is equal to \( \frac{|N|}{|N|} - \frac{16}{16} = 1 \). Since \( N \) is transitive on \{1, 2, 3, 4, 5, 6, 7, 8\} and the orbit of \( N \) on \{1, 2, 3, 4, 5, 6, 7, 8\} is \{1, 2, 3, 4, 5, 6, 7, 8\}. Now, we will determine the double coset to which \( Nt_i \) belongs, where \( i \in \{1, 2, 3, 4, 5, 6, 7, 8\} \). We consider \( i = 1 \), so \( Nt_1 \) is a representative coset, and hence we have a new double coset \( Nt_1N \) which is denote by \([1]\).

Double Coset \([1]\) : We consider the double coset \( NwN \), where \( w \) is a word of length one. \( Nt_1N = \{ n \in N | Nt_1n \} = \{ Nt_1, Nt_2, Nt_3, Nt_4, Nt_5, Nt_6, Nt_7, Nt_8 \} \).

We consider the coset stabilizer \( N^{(1)} \), note that the coset stabilizer of \( Nt_1 \) is equal to the point stabilizer \( N^1 \). \( N^{(1)} = \{ n \in N | Nt_1^n = t_1 \} \geq < (2, 5)(3, 7) > \).

Since \( |N^{(1)}| = 2 \) then the number of single cosets in \([1]\) is \( \frac{|N|}{|N^{(1)}|} = \frac{16}{2} = 8 \).
Now, the orbits of $N(1)$ on $\{1, 2, 3, 4, 5, 6, 7, 8\}$ are $\{1\}, \{4\}, \{6\}, \{8\}, \{2, 5\},$ and $\{3, 7\}$. We choose a representative from each orbit.

If we select $t_1$ from the orbit $\{1\}$, $t_4$ from the orbit $\{4\}$, $t_6$ from the orbit $\{6\}$, $t_8$ from the orbit $\{8\}$, $t_2$ from the orbit $\{2, 5\}$, and $t_7$ from the orbit $\{3, 7\}$, we notice the following:

- $Nt_1t_1 = Nt_1^2 = N \in [*]$
  
  This will collapse and hence it goes back to the double coset $[*]$ since $t_1^2 = e$.

- $Nt_1t_4 = Nt_1t_4 \in [14]$
  
  This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[14]$. Since there is one element in this orbit, there is one $t_i$ that extend $[1]$ to $[14]$.

- $Nt_1t_6 = Nt_4 \in [1]$
  
  By the second relation $(w * x * y)^3 * t_4 * t_6 = t_1$ if we add $t_6$ to both sides, we will get that

  $$(w * x * y)^3 * t_4 * t_6 * t_6 = t_1 * t_6$$
  $$(w * x * y)^3 * t_4 * e = t_1 * t_6$$
  $$(w * x * y)^3 * t_4 = t_1 * t_6.$$  

  So, $t_1t_6 \sim t_1 \in [1]$.

Since there is one element in the orbit $\{6\}$, so one element will loop back into the double coset $[1]$.

- $Nt_1t_8 = Nt_4 \in [1]$

  Because if we conjugate the second relation $t_4 * t_6 = t_1$ by $(1,4)(2,5)(3,7)(6,8) \in N$, we will get on $t_1 * t_8 = t_4$.

  Since there is one element in the orbit $\{8\}$, so one element will loop back into the double coset $[1]$.

- $Nt_1t_2 = Nt_1 \in [1]$

  By the first relation $t_1t_2 = x^3t_1$. Since there are two elements in the orbit $\{2, 5\}$, so two elements will loop back into the double coset $[1]$.

- $Nt_1t_7 = Nt_1t_7 \in [17]$

  This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[17]$. Since there are two elements in this orbit $\{3, 7\}$, there are two $t_i$s that extend $[1]$ to $[17]$.

  Thus, $t_1$ takes $[1]$ to $[*]$ and $t_2, t_8, t_6, t_5$ take $[1]$ to itself.
Double Coset [14]: We are a new double coset [14]. \( Nt_1t_4N = \{ n \in N | N(t_1t_4)n \} \).

Now, we will determine the coset stabilizer \( N^{(14)} \), so the coset stabilizer of \( Nt_1t_4 \) is given by: \( N^{(14)} = \{ n \in N | N(t_1t_4)^n = Nt_1t_4 \} \geq <(2,5)(3,7),(1,3,4,7)(2,6,5,3)> \).

If we conjugate \( t_1t_4 \) by all elements of \( N \), we notice that we have these single cosets are equal to each other: \( 14 \sim 73 \sim 68 \sim 52 \sim 86 \sim 25 \sim 37 \). The number of single cosets in the double coset \([14]\) is \( |N| |N^{(14)}| = 16 \times 16 = 256 \) a single coset in \([14]\). As a result, all of eight \( t_i \) take \([14]\) to 1.

Double Coset [17]: We are a new double coset [17]. \( Nt_1t_7N = \{ n \in N | N(t_1t_7)n \} \).

Now, we will determine the coset stabilizer \( N^{(17)} \), so the coset stabilizer of \( Nt_1t_7 \) is given by: \( N^{(17)} = \{ n \in N | N(t_1t_7)^n = Nt_1t_7 \} \geq <(1,4)(2,5)(3,7)(6,8)> \).

When we conjugate \( t_1t_7 \) by all elements of \( N \), it gives us a list of 8 single cosets, they have equal names: \( 17 \sim 43 \sim 26 \sim 34 \sim 58 \sim 62 \sim 71 \sim 85 \). The number of single cosets in the double coset \([17]\) is \( |N| |N^{(17)}| = 16 \times 8 = 128 \) a single coset in \([17]\). Next, we can see that the orbits of \( N^{(17)} \) on \( \{1,2,3,4,5,6,7,8\} \) is \( \{1,2,3,4,5,6,7,8\} \). We now take the representative 7 of the orbit \( \{1,2,3,4,5,6,7,8\} \) and determine that \( Nt_1t_7t_7 = Nt_1 \in [1] \). As a result, all of eight \( t_i \) take \([17]\) to 1.

Finally, we can construct the Cayley diagram. Since the set of right cosets are closed under right multiplication by \( t_i \) where \( i=1,2,3,4,5,6,7,8 \). We can find the index of \( N \) in \( G \). We conclude that

\[
|G| \leq (|N| + \frac{|N|}{|N^{(1)}|} + \frac{|N|}{|N^{(14)}|} + \frac{|N|}{|N^{(17)}|}) \times |N| \\
|G| \leq (1 + 8 + 1 + 2) \times 16 \\
|G| \leq (12 \times 16) \leq 192
\]
8.2.1 Verification of $2^4 : S_3 \times C_2$

Consider the progenitor $2^8 : (2 \times 4 : 2)$ where $N$ is given by:

$S := \text{Sym}(8);$
$ww := S!(2, 5)(3, 7);$
$xx := S!(1, 2)(3, 6)(4, 5)(7, 8);$
$yy := S!(1, 3, 4, 7)(2, 6, 5, 8);$
$zz := S!(1, 4)(2, 5)(3, 7)(6, 8);$
$N := \text{sub}<S|ww, xx, yy, zz>;$
$G<w, x, y, z, t> := \text{Group}<w, x, y, z, t | w^2, x^2, y^4, z^2, (w*y^-1)^2,$
$x*y^-1*x*y^-2*z, w*x*w*x*z, t^2, (t, w), (x*t)^3, (w*x*y*t)^3>;$

We will prove the isomorphism type of $G$. The composition factors of $G$ are:

\begin{verbatim}
G
| Cyclic(2)
* Cyclic(3)
* Cyclic(2)
* Cyclic(2)
\end{verbatim}
The composition series for \( G \) is:
\[
G = G_0 \supseteq G_1 \supseteq G_2 \supseteq G_3 \supseteq G_4 \supseteq G_5 \supseteq G_6 \supseteq G_7
\]
where \( G_7 = 1 \).

The composition factors are:
\[
G = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus G_7)
= (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus 1)
= (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)G_7
= G_2G_2G_2G_2G_2G_3G_2.
\]

The normal lattice of \( G \) is as follows:

Normal subgroup lattice
-----------------------
[10] Order 192 Length 1 Maximal Subgroups: 7 8 9
---
[ 8] Order 96 Length 1 Maximal Subgroups: 6
[ 7] Order 96 Length 1 Maximal Subgroups: 5 6
---
[ 5] Order 32 Length 1 Maximal Subgroups: 3 4
---
---
[ 3] Order 8 Length 1 Maximal Subgroups: 2
---
[ 2] Order 4 Length 1 Maximal Subgroups: 1
---
[ 1] Order 1 Length 1 Maximal Subgroups:

We are looking for the largest abelian group if possible or the center which factor \( G \). In this case, \( G \) does not have a center, so we will find the largest abelian group by the following loop.
for i in [1..#NL] do if IsAbelian(NL[i]) then i; end if; end for;
1
2
3
4
IsAbelian(NL[4]);
true

As we see NL[4] is the largest abelian group. Now, we have to verify if $NL[4] \cong 2^4$ by this Magma code.

X:= [2,2,2,2];
IsIsomorphic(NL[4], AbelianGroup(GrpPerm, (X)));
true

So, Magma tells us that NL[4] isomorphic to the abelian group $2^4$. Therefore, we have that $G_2 = 2^4$. Next, we will factor G1 by NL[4] resulting q which is the quotient group.

H:= NL[4];
q, ff:= quo< G1 | NL[4] >;
q;
Permutation group q acting on a set of cardinality 6
Order = 12 = 2^2 * 3

We will find the normal lattice for q by this Magma loop.

nl:= NormalLattice(q);
nl;
Normal subgroup lattice
-----------------------
---
---
[3] Order 3 Length 1 Maximal Subgroups: 1
[2] Order 2 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:

First, we will fulfill if we have a direct product or not, so we want to see if q is collected of a direct product. Since we posses a normal subgroup of order 6 which is nl[4], and a subgroup of order 2 which is nl[2]. So, the product of two a normal subgroups orders
give us the order of $q=12$. We will check if $q$ is direct product between $nl[4]$ and $nl[2]$ by this loop:

```plaintext
E:=DirectProduct(nl[4],nl[2]);
IsIsomorphic(E,q);
\*
true
*\nIsIsomorphic(nl[4],SymmetricGroup(3));
\*
true
*\nIsIsomorphic(nl[2],CyclicGroup(2));
\*
true
*\n```

As a result, we find that $q \cong S_3 \times C_2$ where $S_3 = nL[4]$ and $C_2 = nL[2]$. Now, we have to write a presentation of $q$. We will write a presentation for $NL[4]$.

```plaintext
FPGroup(NL[4]);
Finitely presented group on 4 generators
Relations
$.1^2 = Id($)
$.2^2 = Id($)
$.3^2 = Id($)
$.4^2 = Id($)
($.1 \ast $.2)^2 = Id($)
($.1 \ast $.3)^2 = Id($)
($.2 \ast $.3)^2 = Id($)
($.1 \ast $.4)^2 = Id($)
($.2 \ast $.4)^2 = Id($)
```

Our presentation is $NL[4]=< w, x, y, z | w^2, x^2, y^2, z^2, (w \ast x)^2, (w \ast y)^2, (x \ast y)^2, (w \ast z)^2, (x \ast z)^2, (y \ast z)^2 >$. Now, we have to find the action $S_3 \times 2$ on $2^4$. We determine the isomorphism type of this group since we had no center in $G$, so it is not a central extension. Also, we did not find a direct product as well since we have no normal subgroup of order 12. Therefore, the isomorphism type of this group must be a semi-direct product or a mixed extension. We will find transversal because it will help us to find a form to connect $q$ to $NL[4]$ to make an isomorphic representation of $G$. 

\(T := \text{Transversal}(G1, NL[4])\);
ff(T[2]) eq q.1;
true
ff(T[3]) eq q.2;
true
ff(T[4]) eq q.5;
true

We will label our generators of \(q\), where \(T[2]\) is \(q.1\), \(T[3]\) is \(q.2\), and \(T[4]\) is \(q.5\).

Generators(NL[4]);
A := G1!(2, 6)(3, 8)(4, 5)(7, 9);
B := G1!(1, 11)(3, 7)(8, 9)(10, 12);
C := G1!(2, 5)(3, 7)(4, 6)(8, 9);
D := G1!(1, 10)(3, 8)(7, 9)(11, 12);
H := G1!T[2];
I := G1!T[3];
J := G1!T[4];

The following Magma code gives us the action of the transversals on the generators
NL[4] are of order 2. A, B, C, D are represented by w, x, y, z and H, I, J are e, f, g.

for i, j, k, l in [1..2] do if A^H eq A^i*B^j*C^k*D^l then i, j, k, l; end if; end for;

We will suppose T[2]=e, T[3]=f and T[4]=g. Now, we will test the elements of q and
their relations. If we write the elements of q as the transversals of G\NL[4] we might
observe the order of the relations changes.
Order(T[2]);
2 doesnt change
Order(T[3]);
2 doesnt change
Order(T[4]);
2 doesnt change
(T[2]*T[3])^2;
(2, 5)(3, 7)(4, 6)(8, 9) the same order does not change
(T[2]*T[4])^2;
Id(G[1]) is equal id so leave alone
(T[4]*T[3])^3;
Id(G[1])

Finally, we have the complete presentation of G, which we verify by using Magma:
$H \langle w, x, y, z, e, f, g \rangle := \text{Group}\langle w, x, y, z, e, f, g \mid w^2, x^2, y^2, z^2, (w*x)^2, (w*y)^2, (x*y)^2, (w*z)^2, (x*z)^2, (y*z)^2, e^2, f^2, g^2, (e*f)^2, (e*g)^2, (g*f)^3, w^e = w*y, w^f = w*y, w^g = x*z, x^e = x, x^f = x*y, x^g = y, y^e = y, y^f = y, y^g = x, z^e = x*z, z^f = w*x*y*z, z^g = w*y >;$

#H;
192
#G1;
192
f1, H1, k1 := CosetAction(H, sub<H|Id(H)>);
s := IsIsomorphic(G1, H1);
s;
true

We solved the extension for $G$, so we could obtain that $G \cong 2^4 : S_3 \times C_2$. 
8.3 Double Coset Enumeration of \((2^5 : S_4)\) over \((2 \times 4 : C_2 \times C_2)\)

Consider the group \(G \cong \frac{2^{16} : (2 \times 4 : C_2 \times C_2)}{[yx^z]\langle yx^z \rangle [yx^z]^3} \cong (2^5 : S_4)\) where \(N = (2 \times 4 : C_2 \times C_2)\). The presentation of \(G\) is given by:

\[
G\langle x, y, z, w, h, t \rangle := \text{Group}\langle x, y, z, w, h, t \rangle \mid x^2, y^2, z^2, w^4, h^2, (yxz)^2, (xw^{-1})^2, (yxw^{-1}zwx^{-1})^2, (ytx)^3, (zxt)^0, (yxt)^6, (yxtz)^3 >;
\]

Where

\[
\begin{align*}
x &\sim (2, 8)(3, 7)(4, 14)(6, 10)(9, 13)(11, 16) \\
y &\sim (1, 2)(3, 9)(4, 8)(5, 10)(6, 14)(7, 11)(12, 16)(13, 15) \\
z &\sim (1, 3)(2, 9)(4, 12)(5, 7)(6, 13)(8, 16)(10, 11)(14, 15) \\
w &\sim (1, 4, 5, 14)(2, 6, 10, 8)(3, 12, 7, 15)(9, 13, 11, 16) \\
h &\sim (1, 5)(2, 10)(3, 7)(4, 14)(6, 8)(9, 11)(12, 15)(13, 16)
\end{align*}
\]

Now, we check the number of single cosets that will appear in our Cayley diagram.

\[
\frac{|G|}{|N|} = \frac{768}{32} = 24,
\]

this means the sum of all single cosets should equal 24 in our Cayley diagram. Next, we will figure out the number of double cosets of our group by helping this Magma code.

\[
\#\text{DoubleCosets}(G, \text{sub}<G| x, y, z, w, h>, \text{sub}<G| x, y, z, w, h>);
\]

5

This means that our Cayley diagram has 5 circles. The next step is that we are going to expand our relations.

The first relation is

\[
\begin{align*}
(y * x * t)^3 &= e \\
(y * x * z * t_1)^3 &= e \text{ since } t \sim t_1 \\
(y * x * z)^3 &* t_1^{(yxz)^2} * t_1^{yxz} * t_1 = e \\
(y * x * z)^3 &* t_4 * t_16 * t_1 = e \\
(y * x * z)^3 &* t_4 * t_16 = t_1
\end{align*}
\]

So, we have \(t_4t_16 \sim t_1\).
The second relation is

\[(y \ast x \ast t)^6 = e \]

\[(y \ast x \ast t)^6 = e \text{ since } t \sim t_1\]

\[(y \ast x)^6 \ast t_1^{(y \ast x)^5} \ast t_1^{(y \ast x)^4} \ast t_1^{(y \ast x)^3} \ast t_1^{y \ast x} \ast t_1 = e \]

\[(y \ast x)^6 \ast t_6 \ast t_5 \ast t_{10} \ast t_{14} \ast t_8 \ast t_1 = e \]

\[(y \ast x)^6 \ast t_6 \ast t_5 \ast t_{10} \ast t_{14} \ast t_8 = t_1 \]

So, we have \(t_6 t_5 t_{10} t_{14} t_8 \sim t_1\).

The last relation is

\[(y \ast t)^3 = e \]

\[(y \ast t)^3 = e \text{ since } t \sim t_1\]

\[y^3 \ast t_1^2 \ast t_1 = e \]

\[y^3 \ast t_1 \ast t_2 \ast t_1 = e \]

\[y^3 \ast t_1 \ast t_2 = t_1 \]

So, we have \(t_1 t_2 \sim t_1\).

**Constructing the Cayley Diagram:**

**Circle One: First Double Coset:**

We will use this definition of a double coset \(NwN = \{n \in N \mid Nw \ast n \} \). We consider our first double coset \(NeN = \{n \in N \mid Ne \ast n \} = \{N \} \) which we denote by \(*\). Our control group \(N\) is transitive on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\} \), so it has a single orbit \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\} \). The number of right cosets in \(*\) is equal to \(\frac{|N|}{|N|} = \frac{32}{32} = 1\). So, we will put 1 into the first circle. Next, we will determine the double coset to which \(Nt_i\) belongs, where \(i \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\} \). We consider \(i=1\), so \(Nt_1\) is a representative coset, and hence we have a new double coset \(Nt_1N\).

**Circle two: Second Double Coset:**

We consider the double coset \(NwN\), where \(w\) is a word of length one.

\(Nt_1N = \{n \in N \mid Nt_1 \ast n \} \). We consider the coset stabilizer \(N^{(1)}\), note that the coset stabilizer of \(Nt_1\) is equal to the point stabilizer \(N^1\). \(N^{(1)} = \{n \in N \mid Nt_1^{n} = t_1 \} \geq < (2, 8)(3, 7)(4, 14)(6, 10)(9, 13)(11, 16) > \). Since \(|N^{(1)}| = 2\) then the number of single
cosets in $[1]$ is $\frac{|N|}{|N(1)|} = \frac{32}{2} = 16$.

Now, the orbits of $N^{(1)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$ are $\{1\}$, $\{5\}$, $\{12\}$, $\{15\}$, $\{2, 8\}$, $\{3, 7\}$, $\{4, 14\}$, $\{6, 10\}$, $\{9, 13\}$ and $\{11, 16\}$.

We take representative from each orbit and determine to which double coset $Nt_1t_1$, $Nt_1t_5$, $Nt_1t_{12}$, $Nt_1t_{15}$, $Nt_1t_2$, $Nt_1t_3$, $Nt_1t_4$, $Nt_1t_6$, $Nt_1t_9$, and $Nt_1t_{11}$ belongs.

We notice the following:

- $Nt_1t_1 = Nt_1^2 = N \in [*]$. This will collapse and hence it goes back to the double coset $[*]$ since $t_1^2 = e$.
- $Nt_1t_{12} = Nt_1t_{12} \in [112]$. This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[112]$.
- $Nt_1t_5 = Nt_1t_5 \in [15]$. This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[15]$. Since there is one element in this orbit, there is one symmetric generator which will extend to the double coset $[15]$.
- $Nt_1t_{15} = Nt_1t_{15} \in [115]$. This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[115]$. Since there is one element in this orbit, there is one $t_i$ that extend $[1]$ to $[115]$.
- $Nt_1t_3 = Nt_1t_3 \in [13]$. This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[13]$. Since there are two elements in this orbit $\{3, 7\}$, there is two $t_i$ that extend $[1]$ to $[13]$.
- $Nt_1t_4 = Nt_1t_4 \in [14]$. This is a new double coset, which will extend the Cayley diagram from $[1]$ to $[14]$. Since there are two elements in this orbit $\{4, 14\}$, there is two $t_i$ that extend $[1]$ to $[14]$.
- $Nt_1t_2 = Nt_1 \in [1]$. By the last relation $y^3 * t_1 * t_2 = t_1$, there are two elements in the orbit $\{2, 8\}$, so two elements will loop back into the double coset $[1]$.
- $Nt_1t_6 = Nt_1 \in [1]$. From this relation $t_1 * t_6 = y * x * w * t_1$, there are two elements in the orbit $\{6, 10\}$, so two elements will loop back into the double coset $[1]$.
- $Nt_1t_9 = Nt_14 \in [1]$. By this relation $t_1 * t_9 = y * x * z * t_{14}$, there are two elements in the orbit $\{9, 13\}$, so
two elements will loop back into the double coset $[1]$.

- $N_{t_{11}}t_{11} = N_{t_{14}} \in [1]$. 

By this relation $t_1 * t_{11} = y * z * x * t_{14}$, there are two elements in the orbit $\{11, 16\}$, so two elements will loop back into the double coset $[1]$.

As a result, we observe that from the previous steps eight elements loop back into the double coset $[1]$ and 5 new double cosets which are $[15], [112], [115], [13], \text{ and } [14]$. Now, we will check by this Magma code if some of these new double cosets are equal.

```magma
for n in IN do if ts[1]*ts[15] eq n*ts[1]*ts[12] then n; end if; end for;
for n in IN do if ts[1]*ts[15] eq n*ts[1]*ts[3] then n; end if; end for;
for n in IN do if ts[1]*ts[3] eq n*ts[1]*ts[12] then n; end if; end for;
```

So, $[112] = [115] = [13]$ the same double cosets. Therefore, we have 3 new double cosets $[115], [15], \text{ and } [14]$.

**Circle Three: Third Double Coset:**

We are a new double coset $[15]$. $N_{t_5}t_5 N = \{n \in N | N_{t_5}t_5 n\}$. The coset stabilizer of $N_{t_5}t_5 N$ is given by $N^{(15)} = \{n \in N | N_{t_5}t_5 n = t_5 t_5\} \geq <(2,8)(3,7)(4,14)(6,10)(9,13)(11,16),(1,2)(3,9)(4,8)(5,10)(6,14)(7,11)(12,16)>(13,15)>$.

When we conjugate $t_1 t_5$ by all elements of $N$, we will observe that there are cosets have equal names and the relation increases our $|N^{(15)}|$. The cosets have equal names as follows: $15 \sim 210 \sim 37 \sim 414 \sim 51 \sim 86 \sim 911 \sim 68 \sim 102 \sim 73 \sim 1215 \sim 144 \sim 1613 \sim 1316 \sim 119 \sim 1512$.

Since $|N^{(15)}|=32$ then the number of single cosets in $[15]$ is $\frac{|N|}{|N^{(15)}|} = \frac{32}{32} = 1$ a single coset in $[15]$. Now, we can see the orbits of $N^{(15)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$ are $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$.

We take 5 representative from the orbit and determine that $N_{t_5}t_5t_5 = N_{t_1} \in [1]$.

As a result, all sixteen $t_i$ take $[15]$ to $[1]$.

**Circle four: Fourth Double Coset:**

We are a new double coset $[112]$. $N_{t_5}t_5 N = \{n \in N | N_{t_5}t_5 n\}$. The coset stabilizer of $N_{t_5}t_5 N$ is given by $N^{(112)} = \{n \in N | N_{t_5}t_5 n = t_5 t_5\} \geq <(2,8)(3,7)(4,14)(6,10)\}$.
is a stabilizer of $N$. We label the fifth double coset $[14]$ and compute the coset stabilizer:

Circle five: Fifth Double Coset

We label the fifth double coset $[14]$ and compute the coset stabilizer $N^{[14]}$. The coset stabilizer of $N_1t_4N_n$ is given by $N^{[14]} = \{ n \in N | N_1t_4 = t_1t_4 \}$. Since $|N^{[14]}| = 16$ then the number of single cosets in $[14]$ is $\frac{|N|}{|N^{[14]}|} = \frac{32}{16} = 2$, a single coset in $[14]$.

Now, we can see the orbits of $N^{[12]}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$ are $\{1, 3, 5, 7\}$, $\{4, 14, 12, 15\}$, and $\{2, 8, 9, 16, 10, 6, 13, 11\}$. We choose a representative from each orbit. If we select $t_3$ from the orbit $\{1, 3, 5, 7\}$, $t_{12}$ from the orbit $\{4, 14, 12, 15\}$ and $t_2$ from the orbit $\{2, 8, 9, 16, 10, 6, 13, 11\}$.

Then, we notice that:

- $N_1t_4t_3 \in [1]$.

From this relation:

\[ t_1t_2 = h \ast t_3t_4 \]
\[ t_1t_2t_3 = h \ast t_4 \in [1]. \]

Therefore, 4 symmetric generators will send to the double coset $[1]$.

- $N_1t_4t_2 = Nt_1 \in [1]$.

Therefore, 4 symmetric generators will send to the double coset $[1]$.

- $N_1t_4t_2 = Nt_{11} \in [1]$.

From this relation:

\[ t_1t_2 = z \ast x \ast t_2t_{11} \]
\[ t_1t_2t_2 = z \ast x \ast t_{11} \in [1]. \]

Therefore, 8 symmetric generators will extend to the double coset $[1]$.

Finally, all of sixteen $t_i$ take $[12]$ to $[1]$.

**Circle five: Fifth Double Coset**

We label the fifth double coset $[14]$ and compute the coset stabilizer $N^{[14]}$. The coset stabilizer of $N_1t_4N_n$ is given by $N^{[14]} = \{ n \in N | N_1t_4 = t_1t_4 \} \geq \langle (1, 2)(3, 9)(4, 8)(5, 10)(6, 14)(7, 11)(12, 16)(13, 15) \rangle$. Since $|N^{[14]}| = 16$, then the number of single cosets in $[14]$ is $\frac{|N|}{|N^{[14]}|} = \frac{32}{16} = 2$, a single coset in $[14]$.

Now, we can see the orbits of $N^{[12]}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$ are $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$.

We choose a representative 4 from the orbit $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$ and determine that $N_1t_4t_4 = Nt_1 \in [1]$. 
As a result, all sixteen $t_i$ take [14] to [1]. Finally, we could construct our Cayley diagram.

\[
|G| \leq \left( \frac{|N|}{|N(1)|} + \frac{|N|}{|N(14)|} + \frac{|N|}{|N(112)|} + \frac{|N|}{|N(15)|} \right) \times |N|
\]

\[
|G| \leq (1 + 16 + 2 + 4 + 1) \times 32
\]

\[
|G| \leq (24 \times 32) \leq 768
\]

![Cayley Graph of (2^5 : S_4) over (2x4 : C_2 x C_2)](image)

Figure 8.2: Cayley Graph of \((2^5 : S_4)\) over \((2 \times 4 : C_2 \times C_2)\)

### 8.3.1 Verification of \((2^5 : S_4)\)

Consider the progenitor \(2^{16} : N\) where \(N\) is given by:

\[
S := \text{Sym}(16);
\]

\[
xx := S!(2, 8)(3, 7)(4, 14)(6, 10)(9, 13)(11, 16);
\]

\[
yy := S!(1, 2)(3, 9)(4, 8)(5, 10)(6, 14)(7, 11)(12, 16)(13, 15);
\]

\[
zz := S!(1, 3)(2, 9)(4, 12)(5, 7)(6, 13)(8, 16)(10, 11)(14, 15);
\]

\[
ww := S!(1, 4, 5, 14)(2, 6, 10, 8)(3, 12, 7, 15)(9, 13, 11, 16);
\]

\[
hh := S!(1, 5)(2, 10)(3, 7)(4, 14)(6, 8)(9, 11)(12, 15)(13, 16);
\]

\[
N := \text{sub}<S | xx, yy, zz, ww, hh>;
\]

We will prove the isomorphism type of \(G\). The composition factors of \(G\) is given by:
The composition series for $G$ is:

$$G = G_0 \supseteq G_1 \supseteq G_2 \supseteq G_3 \supseteq G_4 \supseteq G_5 \supseteq G_6 \supseteq G_7 \supseteq G_8 \supseteq G_9 \text{ where } G_9 = 1$$

The composition factors are:

$$G = (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus G_7)(G_7 \setminus G_8)(G_8 \setminus G_9)$$

$$= (G_0 \setminus G_1)(G_1 \setminus G_2)(G_2 \setminus G_3)(G_3 \setminus G_4)(G_4 \setminus G_5)(G_5 \setminus G_6)(G_6 \setminus G_7)(G_7 \setminus G_8)$$

$$= G_2G_2G_2G_2G_2G_2G_3G_2.$$
We are looking for the largest abelian group if possible or the center which factor $G$. In this case, $G$ does not have a center, so we will find the largest abelian group by the following loop.

```magma
for i in [1..#NL]do if IsAbelian(NL[i]) then i;end if;end for;
\*
1
2
3
4
5
6
9
*\nIsAbelian(NL[9]);
\*
true
```

As we see $NL[9]$ is the largest abelian group. Now, we check $NL[9] \cong 2^5$ by Magma code.

```magma
X:=[2,2,2,2,2];
```
IsIsomorphic(NL[9],AbelianGroup(GrpPerm, (X)));  
true

So, Magma tells us that NL[9] isomorphic to the abelian group $2^5$. Therefore, we have that $G_2 = 2^5$. Now, we can produce a presentation for NL[9] as:

$$S\langle w, x, y, z, v \rangle := \text{Group}\langle w, x, y, z, v \mid w^2, x^2, y^2, z^2, v^2, (w*x)^2, (w*y)^2, (x*y)^2, (w*z)^2, (x*z)^2, (y*z)^2, (w*v)^2, (x*v)^2, (y*v)^2, (z*v)^2 \rangle;$$

$$ff, ss, kk := \text{CosetAction}(S, \text{sub}\langle S | \text{Id}(S) \rangle);$$

$$s, t := \text{IsIsomorphic}(ss, NL[9]);$$

$$s;$$

true

Next, we will factor G1 by NL[9] resulting q which is the quotient group.

$$H := NL[9];$$
$$q, ff := \text{quo}\langle G1 | NL[9] \rangle;$$
$$q;$$

Permutation group q acting on a set of cardinality 4
Order = 24 = 2^3 * 3
(1, 2)(3, 4)
(2, 4)
Id(q)
(1, 3)(2, 4)
Id(q)
(3, 4)

We will now find the normal lattice for q by this Magma loop.

$$nl := \text{NormalLattice}(q);$$
$$nl;$$

Normal subgroup lattice
-----------------------
---
---
[2] Order 4 Length 1 Maximal Subgroups: 1
---
[1] Order 1 Length 1 Maximal Subgroups:

We could figure out q isomorphic to $S_4$ as follows:
IsIsomorphic(SymmetricGroup(4), q);
true
FPGroup(q);
Finitely presented group on 6 generators
Relations
$.1^2 = Id($)
$.2^2 = Id($)
$.4^2 = Id($)
$.6^2 = Id($)
($.1 * $.4)^2 = Id($)
($.2 * $.4)^2 = Id($)
($.1 * $.6)^2 = Id($)
$.1 * $.2 * $.1 * $.2 * $.4 = Id($)
$.6 * $.4 * $.1 * $.6 * $.4 = Id($)
($.6 * $.2)^3 = Id($)
$.3 = Id($)
$.5 = Id($)

The presentation of $q \cong S_4$ as follows:

H<e,f,g,h>:=Group<e,f,g,h|e^2,f^2,g^2,h^2,(e*g)^2,(f*g)^2,
(e*h)^2,e*f*e*f*g,h*g*e*h*g,(h*f)^3>;
ff,ss,kk:=CosetAction(H,sub<H|Id(H)>);
s,t:=IsIsomorphic(q,ss);
s;
true

Now, we begin the approach of defining the action of Q on K by labeling the generators of NL[9] and the generators of q as follows:

H:=NL[9];
qu,ff:=quo<G1|NL[9]>;
q;
Permutation group q acting on a set of cardinality 4
Order = 24 = 2^3 * 3
(1, 2)(3, 4)
(2, 4)
Id(q)
(1, 3)(2, 4)
Id(q)
(3, 4)
EE:=q!(1, 2)(3, 4);
FF:=q!(2, 4);
GG:=q!(1, 3)(2, 4);
\[ DD := q! (3, 4); \]
\[ T := \text{Transversal}(G1, NL[9]); \]
\[ ff(T[2]); \]
\[ ff(T[3]); \]
\[ ff(T[4]); \]
\[ ff(T[5]); \]
\[ ff(T[3]) \text{ eq } FF; \]
\[ \text{true} \]
\[ ff(T[2]) \text{ eq } EE; \]
\[ \text{true} \]
\[ ff(T[4]) \text{ eq } GG; \]
\[ \text{true} \]
\[ ff(T[5]) \text{ eq } DD; \]
\[ \text{true} \]
\[ q \text{ eq sub}<q|EE,FF,GG,DD>; \]
\[ \text{true} \]

We will label our generators of \( q \), where \( T[2], T[3], T[4], \) and \( T[5] \) are represented by \( q.2, q.3, q.4, \) and \( q.6 \), respectively.

```plaintext
Generators(NL[9]);
A:=G1!(1, 24)(2, 7)(3, 9)(4, 15)(5, 6)(8, 19)(10, 20)(11, 21)(12, 13)(14, 18)(16, 22)(17, 23);
B:=G1!(1, 16)(2, 15)(3, 19)(4, 7)(5, 12)(6, 13)(8, 9)(10, 21)(11, 20)(14, 23)(17, 18)(22, 24);
C:=G1!(1, 17)(2, 6)(4, 12)(5, 7)(13, 15)(14, 22)(16, 18)(23, 24);
D:=G1! (2, 6)(3, 11)(4, 12)(5, 7)(8, 10)(9, 21)(13, 15)(19, 20);
F:=G1! (2, 4)(3, 9)(5, 13)(6, 12)(7, 15)(8, 19)(10, 20)(11, 21);
J:=G1!T[2];
I:=G1!T[3];
M:=G1!T[4];
O:=G1!T[5];
```

Now, the following Magma code gives us the action of the transversal on the generators \( NL[9] \) which are of order 2. \( A, B, C, D, \) and \( F \) are represented by \( w, x, y, z, \) and \( v \) and \( J, I, M, \) and \( O \) are represented by \( e, f, g, \) and \( h \).

```plaintext
for i, j, k, l, m in [1..2] do if A^J eq A^i*B^j*C^k*D^l*F^m then i, j, k, l, m; end if; end for;

then i, j, k, l, m; end if; end for;
2 2 1 2 2 --> y^h = y
for i, j, k, l, m in [1..2] do if D^J eq A^i*B^j*C^k*D^l*F^m
then i, j, k, l, m; end if; end for;
2 2 2 1 2 --> z^e = z
for i, j, k, l, m in [1..2] do if D^I eq A^i*B^j*C^k*D^l*F^m
then i, j, k, l, m; end if; end for;
2 2 2 1 2 --> z^f = z
for i, j, k, l, m in [1..2] do if D^M eq A^i*B^j*C^k*D^l*F^m
then i, j, k, l, m; end if; end for;
2 2 2 1 2 --> z^g = z
for i, j, k, l, m in [1..2] do if D^O eq A^i*B^j*C^k*D^l*F^m
then i, j, k, l, m; end if; end for;
2 2 1 1 2 --> z^h = y*z
for i, j, k, l, m in [1..2] do if F^J eq A^i*B^j*C^k*D^l*F^m then i, j, k, l, m; end if; end for;
2 2 1 1 ---> v^e=z*v
for i, j, k, l, m in [1..2] do if F^I eq A^i*B^j*C^k*D^l*F^m then i, j, k, l, m; end if; end for;
2 2 2 1 ---> v^f=v
for i, j, k, l, m in [1..2] do if F^M eq A^i*B^j*C^k*D^l*F^m then i, j, k, l, m; end if; end for;
2 2 2 2 1 ---> v^g=v
for i, j, k, l, m in [1..2] do if F^O eq A^i*B^j*C^k*D^l*F^m then i, j, k, l, m; end if; end for;
1 1 1 1 1 ---> v^h=w*x*y*z*v

Now, we put together presentations of NL[9] and q with words are given above. Thus,
M=Group < w, x, y, z, v, e, f, g, h|w^2, x^2, y^2, z^2, v^2, (w*x)^2, (w*y)^2, (w*z)^2, (x*z)^2, (y*z)^2, (w*v)^2, (x*v)^2, (y*v)^2, (z*v)^2, w^e = w*z, w^f = w*x*y*z, w^g = w*y, w^h = x*y*z, x^e = x*y*z, x^f = x*z, x^g = x*z, x^h = w*z, y^e = y, y^f = y*z, y^g = y, y^h = z, y^e = z, z^f = z, z^g = z, z^h = y*z, v^e = z, v^f = v, v^g = v, v^h = w*x*y*z*v, e^2, f^2, g^2, h^2, (e*g)^2, (f*g)^2, (e*h)^2, e*f*e*f*g, h*g*e*h*g, (h*f)^3 >.

As we see by asking Magma if this is isomorphic to G1, we determine this is true, so we have a semi direct extension. We solved the extension for G, so we could obtain that $G \cong 2^5 : S_4$.

8.4 The Double Coset Enumeration of $2^{4^4} : A_5$ over $2^2$

We take the progenitor $2^{4^4} : A_5$ where $2^{4^4}$ is the free product of 4 copies of cyclic groups of order 2 and we will factor our group by these relations $(y*t)^3$, $(x*t)^5$, and $(x*y*t)^5$. Let $G \cong 2^{4^4} : A_5$ be a symmetric presentation of G given by:

G<x, y, t>:=Group<x, y, t|x^2, y^2, x*y^-1*x*y, t^2, (x*t)^10, (y*t)^3, (x*t)^5, (x*y*t)^5>;
Where \( x = (1, 2)(3, 4) \) and \( y = (1, 3)(2, 4) \).

**Using computer-based program-MAGMA:**
1. The order of our group is equal 60.
2. There are 6 double coset in this double coset enumeration of \( G \) over \( N \).
3. The number of single cosets that will appear in our Cayley diagram, it is \( |G| |N| = \frac{60}{4} = 15 \), this means the sum of all single cosets should equal 15 in our Cayley diagram.

**Relations:**
The next step is that we are going to expand our relations.

**The first relation is:**

\[
\begin{align*}
(y * t)^3 &= e \\
(y * t_1)^3 &= e \text{ since } t \sim t_1 \\
y^3 * t_1^2 * t_1^3 * t_1 &= e \\
y^3 * t_1 * t_3 * t_1 &= e \\
y^3 * t_1 * t_3 &= t_1
\end{align*}
\]

So, we have \( t_1 t_3 \sim t_1 \).

Moreover, if we conjugate the previous relation by all elements of \( N = \{Id(N), (1, 2)(3, 4), (1, 3)(2, 4), (1, 4)(2, 3)\} \). We have
- \( ((1, 3)(2, 4)t_1t_3 = t_1)^e \Rightarrow (1, 3)(2, 4)t_1t_3 = t_1 \).
- \( ((1, 3)(2, 4)t_1t_3 = t_1)^{(1,2)(3,4)} \Rightarrow (2, 4)(1, 3)t_2t_4 = t_2 \).
- \( ((1, 3)(2, 4)t_1t_3 = t_1)^{(1,3)(2,4)} \Rightarrow (3, 1)(4, 2)t_3t_1 = t_3 \).
- \( ((1, 3)(2, 4)t_1t_3 = t_1)^{(1,4)(2,3)} \Rightarrow (4, 2)(3, 1)t_4t_2 = t_4 \).

**The second relation is:**

\[
\begin{align*}
(x * t)^5 &= e \\
(x * t_1)^5 &= e \text{ since } t \sim t_1 \\
x^5 * t_1^4 * t_1^3 * t_1^2 * t_1 &= e \\
x^5 * t_1 * t_2 * t_1 * t_2 * t_1 &= e \\
x^5 * t_1 * t_2 * t_1 &= t_1 * t_2
\end{align*}
\]

So, we have \( t_1 t_2 t_1 \sim t_1 t_2 \).

Moreover, if we conjugate the previous relation by all elements of \( N \), we have
• \((1,2)(3,4)t_1t_2t_1 = t_1t_2\) \(\Rightarrow (1,2)(3,4)t_1t_2t_1 = t_1t_2\)
• \((1,2)(3,4)t_1t_2t_1 = t_1t_2\) \((1,2)(3,4) \Rightarrow (2,1)(4,3)t_2t_2 = t_2t_1\)
• \((1,2)(3,4)t_1t_2t_1 = t_1t_2\) \((1,2)(3,4) \Rightarrow (3,4)(1,2)t_3t_4 = t_3t_4\)
• \((1,2)(3,4)t_1t_2t_1 = t_1t_2\) \((1,4)(2,3) \Rightarrow (4,3)(2,1)t_4t_4 = t_4t_3\)

The last relation is:

\[(x * y * t)^5 = e\]

\[(x * y * t_1)^5 = e \text{ since } t \sim t_1\]

\[(x * y)^5 \ast t_1^{(x * y)^4} \ast t_1^{(x * y)^3} \ast t_1^{(x * y)^2} \ast t_1^{x * y} \ast t_1 = e\]

\[(x * y)^5 \ast t_1 \ast t_4 \ast t_1 \ast t_4 \ast t_1 = e\]

\[(x * y)^5 \ast t_1 \ast t_4 \ast t_1 = t_1t_4\]

So, we have \(t_1t_4t_1 \sim t_1t_4\).

Also, if we conjugate the previous relation by all elements of \(N\), we have

• \((1,4)(2,3)t_1t_4t_1 = t_1t_4\) \(\Rightarrow (1,4)(2,3)t_1t_4t_1 = t_1t_4\)
• \((1,4)(2,3)t_1t_4t_1 = t_1t_4\) \((1,2)(3,4) \Rightarrow (2,3)(1,4)t_2t_2 = t_2t_3\)
• \((1,4)(2,3)t_1t_4t_1 = t_1t_4\) \((1,3)(2,4) \Rightarrow (3,2)(4,1)t_3t_3 = t_3t_2\)
• \((1,4)(2,3)t_1t_4t_1 = t_1t_4\) \((1,4)(2,3) \Rightarrow (4,1)(3,2)t_4t_4 = t_4t_1\)

8.4.1 Constructing the Cayley Diagram:

We will begin the manual double coset enumeration by looking at our first double coset.

**Double Coset \([\ast]\):**

We will use this definition of a double coset \(NwN = \{n \in N|Nw^n\}\). We consider our first double coset \(N\epsilon N = \{n \in N|N\epsilon n\} = \{N\epsilon\} = \{N\}\) which we denote by \([\ast]\). Our control group \(N\) is transitive on \(\{1,2,3,4\}\) so, it has a single orbit \(\{1,2,3,4\}\). The number of right cosets in \([\ast]\) is equal to \(\frac{|N|}{\frac{4}{4}} = 1\). Now, we will determine the double coset to which \(N\epsilon_i\) belongs, where \(i \in \{1,2,3,4\}\). We consider \(i=1\), so \(N\epsilon_1\) is a representative coset, and hence we have a new double coset \(N\epsilon_1N\) which is denote by \([1]\).

**Double Coset \([1]\):**

We consider the double coset \(NwN\), where \(w\) is a word of length one. \(NwN = \{n \in \ldots\)
\[N|Nw^n\} N_{t_1}N = \{n \in N|N_{t_1}n\} = \{N_{t_1}, N_{t_2}, N_{t_3}, N_{t_4}\}.

We consider the coset stabilizer \(N^{(1)}\), note that the coset stabilizer of \(N_{t_1}\) is equal to the point stabilizer \(N^1\). \(N^{(1)} = \{n \in N|N_{t_1}^n = t_1\}\) ≥ \(\langle Id(N)\rangle\). Since \(|N^{(1)}| = 1\) then the number of single cosets in \([1]\) is \(|N|/|N^{(1)}| = 4/1 = 4\). Now, the orbits of \(N^{(1)}\) on \{1, 2, 3, 4\} are \{1\}, \{2\}, \{3\}, and \{4\}. We take representative from each orbit and determine to which double coset \(N_{t_1}t_1, N_{t_1}t_2, N_{t_1}t_3, N_{t_1}t_4\) belong.

We observe as follows:

- \(N_{t_1}t_1 = N_{t_1}l_2 = N \in [\ast]\)
  This will collapse and hence it goes back to the double coset \([\ast]\) since \(t_1^2 = e\).

- \(N_{t_1}t_2 = N_{t_1}t_2 \in [12]\).
  One element will move forward to a new double coset represented as \([12]\).

- \(N_{t_1}t_3 = N_{t_1} \in [1]\).
  By this relation \(t_1t_3 = yt_1\), there is one element in the orbit so one element will loop back into the double coset \([1]\).

- \(N_{t_1}t_4 = N_{t_1}t_4 \in [14]\).
  One element will move forward to a new double coset represented as \([14]\).

**Double Coset \([12]\):**

We are a new double coset \([12]\). \(N_{t_1}t_2N = \{n \in N|N_{t_1}t_2n\}\). The coset stabilizer of \(N_{t_1}t_2N\) is given by \(N^{(12)} = \{n \in N|N_{t_1}t_2^n = t_1\}\) ≥ \(\langle e \rangle\).

Since \(|N^{(12)}| = 1\) then the number of single cosets in \([12]\) is \(|N|/|N^{(12)}| = 4/1 = 4\) a single coset in \([12]\).

Next, we conjugate \(N_{t_1}t_2\) by all elements of \(N = \{Id(N), (1, 2)(3, 4), (1, 3)(2, 4), (1, 4)(2, 3)\}\).

We have

- \((t_1t_2)^e = t_1t_2\).
- \((t_1t_2)^{(1, 2)(3, 4)} = t_2t_1\).
- \((t_1t_2)^{(1, 3)(2, 4)} = t_3t_4\).
- \((t_1t_2)^{(1, 4)(2, 3)} = t_4t_3\).

Now, the orbits of \(N^{(12)}\) on \{1, 2, 3, 4\} are \{1\}, \{2\}, \{3\}, and \{4\}. We take representative from each orbit and determine to which double coset \(\{N_{t_1}t_2t_1, N_{t_1}t_2t_2, N_{t_1}t_2t_3, N_{t_1}t_2t_4\}\) belong. We notice the following:

- \(t_1t_2t_1 = x \ast t_1t_2 \in [12].\)

so one element will loop back into the double coset \([12]\).
• $t_1t_2t_2 = t_1 \in [1]$. So, one element will extend from $[12]$ to the double coset $[1]$.
• $t_1t_2t_3 = t_1t_2t_3 \in [123]$. This is a new double coset, which will extend the Cayley diagram from $[12]$ to $[123]$.
Since there is one element in this orbit, there is one $t_i$ that extend $[12]$ to $[123]$.
• $t_1t_2t_4 = t_1t_4 \in [14]$. So, one element will extend from $[12]$ to the double coset $[14]$.

**Double Coset $[14]$ :**

We are a new double coset $[14]$. $N_{14}t_4N = \{n \in N | N_{t_4}t_4n\}$. The coset stabilizer of $N_{t_4}t_4N$ is given by $N^{(14)} = \{n \in N | N_{t_4}t_4^n = t_1t_4\} \geq < Id(N) >$. Since $|N^{(14)}| = 1$ then the number of single cosets in $[12]$ is $\frac{|N|}{|N^{(12)}|} = 4 = 4$ a single coset in $[14]$. Now, the orbits of $N^{(14)}$ on $\{1, 2, 3, 4\}$ are $\{1\}$, $\{2\}$, $\{3\}$, and $\{4\}$. We take representative from each orbit and determine to which double coset $\{N_{t_4}t_4, N_{t_4}t_4t_2, N_{t_4}t_4t_3, N_{t_4}t_4t_4\}$ belong. We notice the following:
• $t_1t_4t_1 = x \ast y \ast t_1t_4 \in [14]$. So, one element will loop back into the double coset $[14]$.
• $t_1t_4t_4 = t_1 \in [1]$. So, one element will extend from $[12]$ to the double coset $[1]$.
• $t_1t_4t_3 = t_1t_4t_3 \in [143]$. This is a new double coset, which will extend the Cayley diagram from $[14]$ to $[143]$. Since there is one element in this orbit, there is one $t_i$ that extends $[14]$ to $[143]$.
• $t_1t_4t_2 = t_1t_2 \in [12]$. So, one element will extend from $[14]$ to the double coset $[12]$.

**Double Coset $[123]$ :**

We are a new double coset $[123]$. $N_{12}t_3t_3N = \{n \in N | N_{t_3}t_3t_3n\}$. The coset stabilizer of $N_{t_3}t_3t_3N$ is given by $N^{(123)} = \{n \in N | N_{t_3}t_3t_3^n = t_1t_2t_2\} \geq < (1, 2)(3, 4), (1, 3)(2, 4), (1, 4)(2, 3) >$. When we conjugate $t_1t_2t_3$ by all elements of $N$, we observed that there are cosets have equal names $123 \sim 214 \sim 341 \sim 432$ and the relation increases our $|N^{(123)}|$. Since $|N^{(123)}| = 4$ then the number of single cosets in $[123]$ is $\frac{|N|}{|N^{(123)}|} = 4 = 1$ a single coset in $[123]$. Now, the orbits of $N^{(123)}$ on $\{1, 2, 3, 4\}$ are $\{1, 2, 3, 4\}$. We take representative from the orbit and determine to which double coset belongs. We will pick $3$ from the orbit $\{1, 2, 3, 4\}$. As a result, four symmetric generators are going to
the double coset \([12]\) because \(t_1t_2t_3t_3 = t_1t_2 \in [12]\).

**Double Coset** \([143]\):

We are a new double coset \([143]\). \(Nt_1t_4t_3N = \{n \in N|Nt_1t_4t_3n\} \). The coset stabilizer of \(Nt_1t_4t_3N\) is given by \(N^{(143)} = \{n \in N|Nt_1t_4t_3n = t_1t_4t_3\} \geq <(1, 2)(3, 4), (1, 3)(2, 4), (1, 4)(2, 3)\rangle\). Since \(|N^{(143)}|=4\) then the number of single cosets in \([143]\) is \(\frac{|N|}{|N^{(143)}|} = \frac{4}{4} = 1\) a single coset in \([143]\). Now, the orbits of \(N^{(143)}\) on \(\{1, 2, 3, 4\}\) are \(\{1, 2, 3, 4\}\). We take representative from the orbit and determine to which double coset belong. We will pick 3 from the orbit \(\{1, 2, 3, 4\}\). As a result, 4 symmetric generators are going from the double coset \([143]\) to \([14]\) because \(t_1t_4t_3t_3 = t_1t_4 \in [14]\).

**Conclusion:**

The double coset enumeration gives that:

\[
|G| \leq (|N| + \frac{|N|}{|N^{(1)}|} + \frac{|N|}{|N^{(12)}|} + \frac{|N|}{|N^{(123)}|} + \frac{|N|}{|N^{(14)}|} + \frac{|N|}{|N^{(143)}|}) \times |N|
\]

\[
|G| \leq (1 + 4 + 4 + 1 + 4 + 1) \times 4
\]

\[
|G| \leq (15 \times 4) \leq 60.
\]
8.5 Manual Double Coset Enumeration of $S_6$ over $(2 \times 4 : 2)$

In the beginning, we can do some steps which help us to figure out our Cayley diagram how it will be. First, we have to calculate that $\frac{|G|}{|N|} = \frac{720}{16} = 45$. This means the sum of all single cosets should equal 45 in our Cayley diagram. Then, we need to know how many double cosets we will have, we can check that by Magma code as follows:

```magma
#DoubleCosets(G,sub<G|w,x,y,z>,sub<G|w,x,y,z>);
8
```

So, our Cayley diagram has 8 double cosets. Now, our group has this presentation $G = \langle x, y, z, w, t \mid x^2, y^2, z^2, w^4, (y*w)^2, (x*w-1)^2, z*w^{-1}, z*w, x*y*x*y*w^{-1}, t^2, (t, x), (y*t)^4, (z*w*t)^3, (y*x*z*t)^6, (x*t*w^{-1})^5, x*t*w^{-1}, t*w^{-1}, (z*t)^4 \rangle$.

Where $x=(2, 5)(6, 8)$, $y=(1, 2)(3, 6)(4, 5)(7, 8)$, $z=(1, 3)(2, 6)(4, 7)(5, 8)$, and $w=(1, 4)(2, 5)(3, 7)(6, 8)$.

Next, we factor our progenitor $2^8.(2\times 4:2) \cong S_6$ by these relations:

**The first relation is:**

$(y*t)^4 = e.$

$(y*t_1)^4 = e$ since $t \sim t_1$.

$y^4 * t_1^3 * t_1^2 * t_1 * t_1 = e.$

$t_2 * t_1 * t_2 * t_1 = e.$

$t_2 * t_1 = t_1 * t_2.$

So, we have $t_2 t_1 \sim t_1 t_2$.

**The second relation is:**

$(z*w*t)^3 = e.$

$(z*w*t_1)^3 = e$ since $t \sim t_1$.

$(z*w)^3 * t_1^{(z*w)^2} * t_1^{z*w} * t_1 = e.$

$(z*w)^3 * t_1 * t_7 * t_1 = e.$

$(z*w)^3 * t_1 = t_1 * t_7.$

So, we have $t_1 \sim t_1 t_7$.

**The third relation is:**

$(y*x*t)^6 = e.$

$(y*x*t_1)^6 = e$ since $t \sim t_1$.

$(y*x)^6 * t_1^{(y*x)^2} * t_1^{(y*x)^4} * t_1^{(y*x)^3} * t_1^{(y*x)^2} * t_1^{y*x} * t_1 = e.$
\[(y \ast x)^6 \ast t_5 \ast t_1 \ast t_2 \ast t_4 \ast t_5 \ast t_1 = e\]
\[(y \ast x)^6 \ast t_5 \ast t_1 \ast t_2 = t_1 \ast t_5 \ast t_4.\]
So, we have \(t_5 t_1 t_2 \sim t_1 t_5 t_4.\)

**The forth relation is:**
\[(y \ast x \ast z \ast t)^5 = e\]
\[(y \ast x \ast z \ast t_1)^5 = e\text{ since } t \sim t_1\]
\[(y \ast x \ast z)^5 \ast t_1^{(y \ast x \ast z)^3} \ast t_1^{(y \ast x \ast z)^3} \ast t_1^{(y \ast x \ast z)^3} \ast t_1^{(y \ast x \ast z)^3} \ast t_1 = e\]
\[(y \ast x \ast z)^5 \ast t_1 \ast t_6 \ast t_4 \ast t_8 \ast t_1 = e\]
\[(y \ast x \ast z)^5 \ast t_1 \ast t_6 = t_1 \ast t_8 \ast t_4\]
So, we have \(t_1 t_6 \sim t_1 t_8 t_4.\)

**The last relation is:**
\[(z \ast t)^4 = e\]
\[(z \ast t_1)^4 = e\text{ since } t \sim t_1\]
\[z^4 \ast t_1^3 \ast t_1^2 \ast t_1 \ast t_1 = e\]
\[z^4 \ast t_3 \ast t_1 \ast t_3 \ast t_1 = e\]
\[z^4 \ast t_3 \ast t_1 = t_1 \ast t_3\]
So, we have \(t_3 t_1 \sim t_1 t_3.\)

**Constructing the Cayley Diagram:**

**NeN :**
We will use this definition of a double coset \(NwN = \{n \in N | Nw^n\}.\)
We consider our first double coset \(NeN = \{n \in N | NeN \} = \{Ne\} = \{N\}\) which we denote by [*]. Our control group \(N\) is transitive on \(\{1, 2, 3, 4, 5, 6, 7, 8\}\), so it has a single orbit \(\{1, 2, 3, 4, 5, 6, 7, 8\}\). The number of right cosets in [*] is equal to \(\frac{|N|}{|N|} = \frac{16}{16} = 1\). So, we have one single double coset in a circle [*]. We take a representative from the orbit and determine to which double coset it belongs. Therefore, we get a new double coset \(Nt_1N.\)

**Nt_1N:**
We consider the double coset \(NwN,\) where \(w\) is a word of length one. \(Nt_1N = \{n \in N | Nt_1n\} = \{Nt_1, Nt_2, Nt_3, Nt_4, Nt_5, Nt_6, Nt_7, Nt_8\}.\) The coset stabilizer is \(N^{(1)}\), and the coset stabilizer of \(Nt_1\) is equal to the point stabilizer \(N^1.\)
We observe that from each orbit and determine to which double coset belong. We notice that \( \{1\} \) to \( \{16\} \).

Since there are two elements in this orbit \( \{12\} \). This is a new double coset, which will extend the Cayley diagram from \( [1] \) to \([12] \).

When we conjugate a symmetric generator loop back into \([12] \). There is two \( t_i \) that extend from \([1] \) to \([12] \). \( Nt_6t_6 \in [16] \). This is a new double coset, which will extend the Cayley diagram from \([1] \) to \([16] \). Since there are two elements in this orbit \( \{6,8\} \), there is two \( t_i \) that extend from \([1] \) to \([16] \).

\( Nt_1t_2N \):

We have a new double coset which is called by \([12] \). We use this definition \( Nt_1t_2N = \{n \in N|Nt_1t_2n\} \). The coset stabilizer of \( Nt_1t_2N \) is given by \( N^{(12)} = \{n \in N|Nt_1t_2^2 = t_1t_2\} \geq <e, (1,2)(3,6)(4,5)(7,8) > \).

When we conjugate \( t_1t_2 \) by all elements of \( N \), we have these cosets which have equal name \( 12 \sim 21 \). Since \( |N^{(12)}| = 2 \) then the number of single cosets in \([12] \) is \( \frac{|N|}{|N^{(12)}|} = \frac{16}{2} = 8 \) single coset in \([12] \). Now, we can see the orbits of \( N^{(12)} \) on \( \{1,2,3,4,5,6,7,8\} \) are \( \{1,2\} \), \( \{3,6\} \), \( \{4,5\} \), and \( \{7,8\} \). We take a representative from each orbit and determine which are belong. We notice that \( Nt_1t_2t_2 = Nt_1 \in [1] \), so two elements send from \([12] \) to \([1] \). \( Nt_1t_2t_3 = Nt_1t_2t_3 \in [123] \), so it is a new double coset. \( Nt_1t_2t_4 = Nt_1t_2 \in [12] \), so two symmetric generators loop back into \([12] \). \( Nt_1t_2t_7 = Nt_1t_6 \in [16] \), so two symmetric generators send from the double coset \([12] \) to \([16] \).

\( Nt_1t_3N \):

We have a new double coset which is denoted by \([13] \). \( Nt_3t_3N = \{n \in N|Nt_3t_3n\} \) and the coset stabilizer of \( Nt_3t_3N \) is given by \( N^{(13)} = \{n \in N|Nt_3t_3^2 = t_1t_3\} \geq <(2,5)(6,8)(1,3)(2,6)(4,7)(5,8) > \). Since \( |N^{(13)}| = 8 \) then the number of single cosets in \([13] \) is \( \frac{|N|}{|N^{(13)}|} = \frac{16}{8} = 2 \) single coset in \([13] \). Now, we can see the orbits of \( N^{(13)} \) on \( \{1,2,3,4,5,6,7,8\} \) are \( \{1,3,4,7\} \), and \( \{2,5,6,8\} \). We take a representative from each orbit and determine which are belong. We notice that \( Nt_1t_3t_3 = Nt_1 \in [1] \), so 4 sym-
metric generators send from the double coset \([13]\) to \([1]\). \(Nt_1t_3t_2=\text{Nt}_1t_3t_2 \in [132]\), so it is a new double coset.

\(\text{Nt}_1t_6\text{N}\):
We label the fifth double coset \([16]\) and compute the coset stabilizer \(N^{(16)}\). The coset stabilizer of \(\text{Nt}_1t_6\text{N}\) is given by \(N^{(16)} = \{n \in N|Nt_1t_6^n = t_1t_6\} \geq e\). Since \(|N^{(16)}| = 1\) then the number of single cosets in \([16]\) is \(\frac{|N|}{|N^{(16)}|} = \frac{16}{1} = 16\) single coset in \([16]\).

Now, we can see the orbits of \(N^{(16)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8\}\) are \(\{1\}\), \(\{2\}\), \(\{3\}\), \(\{4\}\), \(\{5\}\), \(\{6\}\), \(\{7\}\), and \(\{8\}\). We take a representative from each orbit and determine which are belong. We observe that \(\text{Nt}_1t_0t_1=\text{Nt}_1t_6t_1 \in [161]\), so this is new double coset. \(\text{Nt}_1t_6t_2=\text{Nt}_1t_2t_3 \in [123]\). \(\text{Nt}_1t_4t_3=\text{Nt}_1t_2t_2 \in [132]\). \(\text{Nt}_1t_6t_4=\text{Nt}_1t_6 \in [16]\). \(\text{Nt}_1t_6t_5=\text{Nt}_1t_2 \in [12]\). \(\text{Nt}_1t_6t_6=\text{Nt}_1 \in [1]\). \(\text{Nt}_1t_6t_7=\text{Nt}_1t_6 \in [16]\). \(\text{Nt}_1t_6t_8=\text{Nt}_1t_6 \in [16]\).

\(\text{Nt}_1t_2t_3\text{N}\):
Now, we label the new double coset \([123]\) and compute the coset stabilizer \(N^{(123)}\). The coset stabilizer of \(\text{Nt}_1t_2t_3\text{N}\) is given by \(N^{(123)} = \{n \in N|Nt_1t_2t_3^n = t_1t_2t_3\} \geq e\). Since \(|N^{(123)}| = 4\) then the number of single cosets in \([123]\) is \(\frac{|N|}{|N^{(123)}|} = \frac{16}{4} = 4\) single coset in \([123]\). Now, the orbits of \(N^{(123)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8\}\) are \(\{1, 2, 7, 8\}\), and \(\{3, 6, 4, 5\}\). We take a representative from each orbit and determine which are belong. We could see that \(\text{Nt}_1t_2t_3t_1=\text{Nt}_1t_6 \in [16]\). \(\text{Nt}_1t_2t_3t_3=\text{Nt}_1t_2 \in [12]\).

\(\text{Nt}_1t_3t_2\text{N}\):
We label the new double coset \([132]\) and calculate the coset stabilizer \(N^{(132)}\). The coset stabilizer of \(\text{Nt}_1t_3t_2\text{N}\) is given by \(N^{(132)} = \{n \in N|Nt_1t_3t_2^n = t_1t_3t_2\} \geq e\). Since \(|N^{(132)}| = 4\) then the number of single cosets in \([132]\) is \(\frac{|N|}{|N^{(132)}|} = \frac{16}{4} = 4\) single coset in \([132]\). Now, the orbits of \(N^{(132)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8\}\) are \(\{2, 6\}\), \(\{5, 8\}\), and \(\{1, 3, 4, 7\}\). We take a representative from each orbit and determine which are belong. We could see that \(\text{Nt}_1t_3t_2t_2=\text{Nt}_1t_3 \in [13]\). \(\text{Nt}_1t_3t_2t_5=\text{Nt}_1t_3t_2 \in [132]\). \(\text{Nt}_1t_3t_2t_1=\text{Nt}_1t_6 \in [16]\).

\(\text{Nt}_1t_6t_1\text{N}\)
We label the last double coset $[161]$ and calculate the coset stabilizer $N^{(161)}$. The coset stabilizer of $N t_1 t_6 t_1 N$ is given by $N^{(161)} = \{ n \in N | N t_1 t_6 t_1^n = t_1 t_6 t_1 \} \geq <(1, 2)(3, 6)(4, 5)(7, 8), (1, 3)(2, 6)(4, 7)(5, 8)>$. Since $|N^{(161)}|=8$ then the number of single cosets in $[161]$ is $\frac{|N|}{|N^{(161)}|} = \frac{16}{8} = 2$ single cosets in $[161]$.

Now, the orbits of $N^{(161)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8\}$ are $\{1, 2, 3, 4, 5, 6, 7, 8\}$. We take a representative from the orbit and determine which is belongs. So, we take 1 from the orbit $\{1, 2, 3, 4, 5, 6, 7, 8\}$. $N t_1 t_6 t_1 = N t_1 t_6 \in [16]$, so 8 symmetric generators go to $[16]$.

Finally, we could build our Cayley diagram.

$$|G| \leq (|N| + \frac{|N|}{|N^{(1)}|} + \frac{|N|}{|N^{(12)}|} + \frac{|N|}{|N^{(13)}|} + \frac{|N|}{|N^{(16)}|} + \frac{|N|}{|N^{(123)}|} + \frac{|N|}{|N^{(161)}|}) \times |N|$$

$$|G| \leq (1 + 8 + 8 + 2 + 16 + 4 + 4 + 2) \times 16$$

$$|G| \leq (45 \times 16) \leq 720$$

![Figure 8.4: Cayley Graph of $S_6$ over $(2 \times 4) : 2$](image)
8.6 Double Coset Enumeration of $2^5 : S_3 \times S_3$ over $S_3 \times S_3$

Consider the group $rac{\mathbb{Z}^2}{\mathbb{Z} x \mathbb{Z} y \mathbb{Z} w}$, where $x \sim (1,2,9)(3,4,5)(6,7,8)$, $y \sim (3,6)(4,7)(5,8)$, $z \sim (1,2)(4,5)(7,8)$, and $w \sim (1,4,7)(2,5,8)(3,6,9)$.

First, we are going to expand our relations.

The first relation is

$((x * w) * t)^4 = e$

$((x * w) * t_1)^4 = e$ since $t \sim t_1$

$(x * w)^4 * t^4_1 * t_1^2 * t_1^3 = e$

$x * w)^4 * t_1 * t_6 * t_5 * t_1 = e$

$(x * w)^4 * t_1 * t_6 = t_1 * t_5$

So, we have $t_1 t_6 \sim t_1 t_5$.

The second relation is

$((z * w) * t)^6 = e$

$((z * w) * t_1)^6 = e$ since $t \sim t_1$

$(z * w)^6 * t^5_1 * t_1^4 * t_1^2 = e$

$(z * w)^6 * t_8 * t_4 * t_2 * t_7 * t_5 * t_1 = e$

$(z * w)^6 * t_8 * t_4 * t_2 = t_1 * t_5 * t_7$

So, we have $t_8 t_4 t_2 \sim t_1 t_5 t_7$.

The third relation is

$((x * y) * t)^4 = e$

$((x * y) * t_1)^4 = e$ since $t \sim t_1$

$(x * y)^4 * t^3_1 * t_1^2 * t_1 = e$

$(x * w)^4 * t_1^3 * t_9 * t_2 * t_1 = e$

$(x * w)^4 * (3,6)(4,7)(5,8) * t_9 = t_1 * t_2$

So, we have $N(3,6)(4,7)(5,8)t_9 = Nt_1 t_2$.

The last relation is

$((x * y * w^{-1}) * t)^6 = e$

$((x * y * w^{-1}) * t_1)^6 = e$ since $t \sim t_1$

$(x * y * w^{-1})^6 * t^5_1 * t_1^4 * t_1^3 = e$

$t_6 * t_2 * t_7 * t_9 * t_8 * t_1 = e$
So, we have \( N t_0 t_2 t_7 = N t_1 t_8 t_9 \).

First, \( N e N = \{ n \in N | N e n = e \} = \{ e \} = \{ N \} \) which we denote by \([^*]\). Our control group \( N \) is transitive on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) so, it has a single orbit \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \). The number of right cosets in \([^*]\) is equal to \( \frac{|N|}{|N|} = \frac{36}{36} = 1 \). So, we have one single double coset in a circle \([^*]\). Now, we right multiply our coset representative \( N \) by \( t_1 \) and find to which double coset \( N t_1 \) belongs. Therefore, we get a new double coset \( N t_1 N \).

Next, we consider \( N t_1 \) be the coset representative of the new double coset \( N t_1 N \). \( N t_1 N = \{ n \in N | N t_1 n = N t_1 \} = \{ N t_1, N t_2, N t_3, N t_4, N t_5, N t_6, N t_7, N t_8, N t_9 \} \). The coset stabilizer is \( N^{(1)} \), and the coset stabilizer of \( N t_1 \) is equal to the point stabilizer \( N^1 \).

\[ N^{(1)} = \{ n \in N | N t_1^n = t_1 \} \geq < e >. \]

We compute that \( \frac{|N|}{|N^{(1)}|} = \frac{36}{4} = 9 \) single cosets in \([1]\). Now, the orbits of \( N^{(1)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) are \{1\}, \{2, 9\}, \{4, 7\}, and \( \{3, 6, 5, 8\} \). We take a representative from each orbit and determine to which double coset belongs. We observe that \( N t_1 t_1 = N t_1^2 = N \in \ [^*] \), so it goes to the double coset \([^*]\) since \( t_1^2 = e \). \( N t_1 t_2 = N t_1 t_4 \in [14] \), so this is a new double coset, 4 symmetric generators extend from \([1]\) to the new double coset \([14]\). \( N t_1 t_3 = N t_1 t_3 \in [13] \), so this is a new double coset, 4 symmetric generators extend from \([1]\) to the new double coset \([13]\). Now, we have a new double coset which is called by \([14]\). We use this definition \( N t_1 t_4 N = \{ n \in N | N t_1 t_4 n \} \). The coset stabilizer of \( N t_1 t_4 N \) is given by \( N^{(14)} = \{ n \in N | N t_1 t_4^n = t_1 t_4 \} \geq < (2, 9)(3, 5)(6, 8), (3, 6)(4, 7)(5, 8) >. \) Since \( |N^{(14)}| = 4 \) then the number of single cosets in \([14]\) is \( \frac{|N|}{|N^{(14)}|} = \frac{36}{4} = 9 \) single coset in \([14]\). The orbits of \( N^{(14)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) are \{1\}, \{2, 9\}, \{4, 7\}, and \( \{3, 6, 5, 8\} \). Now, we choose a representative from each orbit. \( N t_1 t_2 t_4 = N t_1 t_4 t_1 \in [141] \), so this is a new double coset, one symmetric generators extends from \([1]\) to the new double coset \([141]\). \( N t_1 t_4 t_2 = N t_1 \in [1] \), so 2 symmetric generators go from \([14]\) to \([1]\). \( N t_1 t_4 t_3 = N t_1 t_3 t_1 \in [1] \), so 4 symmetric generators extend from \([14]\) to \([1]\). \( N t_1 t_4 t_3 = N t_1 t_3 t_1 \in [1] \), so 4 symmetric generators extend from \([14]\) to \([1]\). Now, we consider \( N t_1 t_4 t_1 N \). \( N t_1 t_4 t_1 N = \{ n \in N | N t_1 t_4 t_1 n \} \). The coset stabilizer of \( N t_1 t_4 t_1 N \) is given by \( N^{(141)} = \{ n \in N | N t_1 t_4 t_1^n = t_1 t_4 t_1 \} \geq < (2, 9)(3, 5)(6, 8), (1, 2, 9)(3, 4, 5)(6, 7, 8), (1, 2)(4, 5)(7, 8) >. \) Since \( |N^{(141)}| = 36 \) then the number of single cosets in \([141]\) is \( \frac{|N|}{|N^{(141)}|} = \frac{36}{36} = 1 \) single coset in \([141]\). The orbit of \( N^{(141)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) is \{1, 2, 3, 4, 5, 6, 7, 8, 9\}. We pick a representative from the orbit, we select \( t_1 \), and determine to which double coset \( N t_1 t_4 t_1 t_1 \) belongs.
Therefore, \( Nt_1t_3t_1 = Nt_1t_4e = Nt_1t_4 \in [14] \), so 9 symmetric generators go from [141] to [14]. Now, we have a new double coset which is called by [13]. We use this definition \( Nt_1t_3N = \{ n \in N \mid Nt_1t_3n \} \). The coset stabilizer of \( Nt_1t_3N \) is given by \( N^{(13)} = \{ n \in N \mid Nt_1t_3^n = t_1t_3 \} \geq (1, 5, 6)(2, 3, 7)(4, 8, 9), (2, 9)(3, 8)(4, 7)(5, 6) \). Since \( |N^{(13)}|=6 \) then the number of single cosets in [13] is \( |N| \frac{36}{6} = 6 \) single coset in [13]. The orbits of \( N^{(13)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) are \( \{1, 5, 6\}, and \{2, 3, 9, 4, 7, 8\} \). We take a representative from the orbit, so we select \( t_3 \), and \( t_1 \) and determine to which double coset \( Nt_1t_3t_3 \) and \( Nt_1t_3t_1 \) belongs. Therefore, \( Nt_1t_3t_3 = Nt_1e = Nt_1 \in [1] \), so 6 symmetric generators are going to the double coset [1]. \( Nt_1t_3t_1 = Nt_1t_3t_1 \in [131] \) this is new double coset denoted by [131]. Thus, 3 symmetric generators are going to the new double coset [131].

We consider \( Nt_1t_3t_1N \). \( Nt_1t_3t_1N = \{ n \in N \mid Nt_1t_3t_1n \} \). The coset stabilizer of \( Nt_1t_3t_1N \) is given by \( N^{(131)} = \{ n \in N \mid Nt_1t_3t_1^n = t_1t_3t_1 \} \geq < (1, 3, 8)(2, 4, 6)(5, 7, 9), (2, 9)(3, 8)(4, 7)(5, 6) >. \) Since \( |N^{(131)}|=6 \) then the number of single cosets in [131] is \( |N| \frac{36}{6} = 6 \) single coset in [131]. The orbits of \( N^{(131)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9\} \) are \( \{1, 3, 8\}, and \{2, 4, 9, 6, 7, 5\} \). We take a representative from the orbit, so we select \( t_2 \), and \( t_1 \) and determine to which double coset \( Nt_1t_3t_1t_1 \) and \( Nt_1t_3t_1t_2 \) belongs. \( Nt_1t_3t_1t_1 = Nt_1t_3e = Nt_1t_3 \in [13] \), so 3 symmetric generators are going to the double coset [13]. \( Nt_1t_3t_1t_2 = Nt_1t_4 \in [14] \). Thus, 6 symmetric generators send from [131] to the double coset [14].

Finally, we could build our Cayley diagram.

\[
|G| \leq (|N| + \frac{|N|}{|N^{(1)}|} + \frac{|N|}{|N^{(11)}|}) \times |N| \leq (1 + 9 + 9 + 6 + 1 + 6) \times 36 = 32 \times 36 = 1152.
\]
8.7 Double Coset Enumeration of $3^3 : S_4 \times C_2$ over $S_3 \times S_3$

We factor our group $G = \text{Group} < x, y, z, w, t | x^3, y^2, z^2, w^3, x^{-1} * y * x * y, (x^{-1} * z)^2, (y * z)^2, (x, w), (y * w^{-1})^2, z * w^{-1} * z * w, t^2, (t, y), (t, x * z), (w * t)^2, ((x * y) * t)^6, ((x * y * w^{-1}) * t)^4 >$ by $(w * t)^3, ((x * y) * t)^6,$ and $((x * y * w^{-1}) * t)^4$.

Note, $x \sim (1, 2, 9)(3, 4, 5)(6, 7, 8)$, $y \sim (3, 6)(4, 7)(5, 8)$, $z \sim (1, 2)(4, 5)(7, 8)$, and $w \sim (1, 4, 7)(2, 5, 8)(3, 6, 9)$.

Now, we compute the number of single cosets, so $\frac{|G|}{|N|} = \frac{1296}{36} = 36$ this means the sum of all single cosets should equal 36 in our Cayley diagram. We will now check the number of double cosets of our group by using Magma.

```
#DoubleCosets(G, sub<G|x, y, z>, sub<G|x, y, z, w>);
```
This indicates that our Cayley diagram has 5 circles.

Now, we will begin to construct our Cayley diagram. We will start with double coset \(NeN\), where \(e\) is the word of length zero denote by \([*]\). \(NeN = \{n \in N | Nen\} = \{N e\} = \{N\}\) which we denote by \([*]\). Our control group \(N\) is transitive on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9\}\) so, it has a single orbit \(\{1, 2, 3, 4, 5, 6, 7, 8, 9\}\). The number of right cosets in \([*]\) is equal to \(\frac{|N|}{|N|} = \frac{36}{36} = 1\). So, we have one single double coset in a circle \([*]\). Now, we right multiply our coset representative \(N\) by \(t_1\) and find to which double coset \(Nt_1\) belongs. Therefore, we get a new double coset \(Nt_1N\).

Next, we are a new double coset which is labeled by \([1]\). \(Nt_1N = \{n \in N | Nt_1n\} = \{Nt_1, Nt_2, Nt_3, Nt_4, Nt_5, Nt_6, Nt_7, Nt_8, Nt_9\}\). The coset stabilizer is \(N^{(1)}\), and the coset stabilizer of \(Nt_1\) is equal to the point stabilizer \(N^1\).
\[
N^{(1)} = \{n \in N | Nt_1^n = t_1\} \geq < e >.
\]
We determine that \(\frac{|N|}{|N^{(1)}|} = \frac{36}{4} = 9\) single cosets in \([1]\). The orbits of \(N^{(1)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9\}\) are \(\{1\}, \{2, 9\}, \{4, 7\}, \text{and} \{3, 6, 5, 8\}\).

We pick a representative from each orbit and determine to which double coset belongs.

We see that \(Nt_1t_1 = Nt_1^2 = N \in [*]\), so it goes to the double coset \([*]\) since \(t_1^2 = e\).

\(Nt_1t_2 = Nt_1t_2 \in [12]\). This is a new double coset, so 2 symmetric generators extend from \([1]\) to the new double coset \([12]\). \(Nt_1t_4 = Nt_1 \in [1]\), so 2 symmetric generators loop back into \([1]\). \(Nt_1t_3 \in [13]\). This is a new double coset, so 4 symmetric generators extend from \([1]\) to the new double coset \([13]\). Now, we have a new double coset which is called by \([12]\).

We use this definition \(Nt_1t_2N = \{n \in N | Nt_1t_2n\}\). The coset stabilizer of \(Nt_1t_2N\) is given by \(N^{(12)} = \{n \in N | Nt_1t_2^n = t_1t_2\} \geq < (3, 6)(4, 7)(5, 8), (1, 2, 9)(3, 4, 5)(6, 7, 8) >\).

Since \(|N^{(12)}| = 6\) then the number of single cosets in \([12]\) is \(\frac{|N|}{|N^{(12)}|} = \frac{36}{6} = 6\) single coset in \([12]\). The orbits of \(N^{(12)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9\}\) are \(\{1, 2, 9\}, \text{and} \{3, 6, 4, 7, 5, 8\}\). We take a representative from each orbit, so we select \(t_2\), and \(t_3\) and determine to which double coset \(Nt_1t_2t_3\) and \(Nt_1t_2t_3\) belongs. Therefore, \(Nt_1t_2t_2 = Nt_1e = Nt_1 \in [1]\), so 3 symmetric generators are going to the double coset \([1]\). \(Nt_1t_2t_3 = Nt_1t_3 \in [13]\). Thus, 6 symmetric generators are going to the new double coset \([13]\). We have a new double coset which is called by \([13]\). \(Nt_1t_3N = \{n \in N | Nt_1t_3n\}\). The coset stabilizer of \(Nt_1t_3N\) is given by \(N^{(13)} = \{n \in N | Nt_1t_3^n = t_1t_3\} \geq < (1, 4)(2, 3)(5, 9)(6, 8) >\).

Since \(|N^{(13)}| = 2\) then the number of single cosets in \([13]\) is \(\frac{|N|}{|N^{(13)}|} = \frac{36}{2} = 18\) single coset in \([13]\). The orbits of \(N^{(13)}\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9\}\) are \(\{7\}, \{1, 4\}, \{2, 3\}, \{5, 9\}, \text{and} \{6, 8\}\). We take a
representative from each orbit, and determine to which double coset belongs. Therefore, $Nt_1t_3t_7 = Nt_1t_3t_7 \in [137]$ this is a new double coset. $Nt_1t_3t_1 = Nt_1t_3 \in [13]$. Thus, 2 symmetric generators loop back into the double coset $[13]$. $Nt_1t_3t_3 = Nt_1e = Nt_1 \in [1]$ since $t_3^2 = e$, so 2 symmetric generators send to the double coset $[1]$. $Nt_1t_3t_5 = Nt_1t_3 \in [13]$, so 2 symmetric generators loop back into $[13]$. $Nt_1t_3t_6 = Nt_1t_2 \in [12]$, so 2 symmetric generators send to $[12]$. We have a new double coset which is called by $[137]$. $Nt_1t_3t_7 N = \{ n \in N | Nt_1t_3t_7 n \}$. The coset stabilizer of $Nt_1t_3t_7 N$ is given by $N^{(137)} = \{ n \in N | Nt_1t_3t_7^2 = t_1t_3t_7 \} \geq \langle (1, 2, 9),(3, 4, 5),(6, 7, 8), (1, 4, 7)(2, 5, 8)(3, 6, 9) \rangle$. Since $|N^{(137)}|=18$ then the number of single cosets in $[137]$ is $\frac{|N|}{|N^{(137)}|} = 36 = 2$ single coset in $[137]$. The orbit of $N^{(137)}$ on $\{1, 2, 3, 4, 5, 6, 7, 8, 9\}$ is $\{1, 2, 4, 9, 5, 7, 3, 8, 6\}$. We take a representative from the orbit, and determine to which double coset belongs. Therefore, $Nt_1t_3t_7 t_7 = Nt_1t_3 \in [13]$, so 9 symmetric generators are going to the double coset $[13]$. Finally, we could create our Cayley diagram.

$|G| \leq (|N| + \frac{|N|}{|N^{(11)}|} + \frac{|N|}{|N^{(12)}|} + \frac{|N|}{|N^{(13)}|} + \frac{|N|}{|N^{(137)}|}) \times |N|$

$|G| \leq (1 + 9 + 6 + 18 + 2) \times 36$

$|G| \leq (36 \times 36) \leq 1296.$

---

Figure 8.6: Cayley Graph of $3^3 : S_4 \times C_2$ over $S_3 \times S_3$
Chapter 9

Double Coset Enumeration over a Maximal Subgroup

Before we will start to find the double coset enumeration over maximal subgroup for $M_{11}$ over $S_5$, we have to know why we need to find the coset enumeration over maximal subgroup. Typically, double coset enumeration is performed over the control $N$ as the previous examples. At the time this process can be very complicated and boring. As a result, to make this process is a much easier process, we can achieve the same what we want by doing the process of double coset enumeration over a maximal subgroup of our progenitor. Therefore, to create the double coset enumeration of $M$ over $N$, we will take $N \leq M \leq G$ and accomplish the single coset enumeration of $G = \cup M_{11} \leq S_5$.

9.1 Double Coset Enumeration of $M_{11}$ over Maximal Subgroup $S_5$

Consider the group $G = \frac{11^{4} \cdot m(5,4)}{(y * (t)^9)^3(y * (t^{10}))^6}$, where $N \cong 5 : 4$. A symmetric presentation of $G$ is $G = \text{Group} < x, y, t | x^5, y^4, y^3 * x^3 * y * x, t^{11}, t^x = t^5, (y * (t^9))^3, (y * (t^{10}))^6 >$. When we computed how many double coset of our group over $N$, so we get 25 double coset of $M_{11}$ over $N$. Also, we could fulfill from that, we have a suitable maximal subgroup in our case that gives opartanity to apply double coset enumeration over $M$. First of all, we ask Magma for maximal subgroups of $M$ as follows:
> M:=MaximalSubgroups(G1);
> M;
Conjugacy classes of subgroups
-----------------------------------
[1] Order 48 Length 165
Permutation group acting on a set of cardinality 396
Order = 48 = 2^4 * 3
[2] Order 120 Length 66
Permutation group acting on a set of cardinality 396
Order = 120 = 2^3 * 3 * 5
Permutation group acting on a set of cardinality 396
Order = 660 = 2^2 * 3 * 5 * 11
[4] Order 144 Length 55
Permutation group acting on a set of cardinality 396
Order = 144 = 2^4 * 3^2
Permutation group acting on a set of cardinality 396
Order = 720 = 2^4 * 3^2 * 5

Now, we ask Magma to find how many suitable candidates which are divisible by N.

> for i in [1..5] do #M[i]`subgroup; end for;
48
120
660
144
720

Then, we will conjugate and determine M[2]`subgroup of order 120 is the maximal subgroup which contains N.

> D:=Conjugates(G1,M[2]`subgroup);
> DD:=Setseq(D);
> for i in [1..#DD] do if f(x) in DD[i] and f(y) in DD[i]
then i;end if; end for;
61
> for g in DD[61] do if Order(g) eq 2 and sub<DD[61]|f(x),f(y),g> eq DD[61] then g@rho;
end if; end for;
g:=WordGroup(G1);
rho:=InverseWordMap(G1);
g2:=function w9 := g.3 * g.1; w10 := w9 * g.2;
\[ w_{18} := w_{10} \cdot g.2; \ w_{3} := g.3^{-1}; \ w_{19} := w_{18} \cdot w_{3}; \]
return \( w_{19} \); end function;

> g2(G);
\[ t \cdot x \cdot y^2 \cdot t^{-1} \]
> H:=sub<G|x,y,t \cdot x \cdot y^2 \cdot t^{-1}>;
> #H;
120
> #DoubleCosets(G,sub<G|x,y>,H);
7
> f, G1, k:=CosetAction(G,sub<G|x,y>);
> CompositionFactors(f(H));
\[
\begin{array}{l}
G \\
| \ Cyclic(2) \\
* \\
| \ Alternating(5) \\
1
\end{array}
\]

Now, we can begin our process to find our double coset of \( M_{11} \) over \( M = \langle f(x), f(y), f(t \cdot x \cdot y^2 \cdot t^{-1}) \rangle \) which is isomorphic to \( S_5 \).

We need to find the total number of unique cosets of \( M \) in \( G \). This is the index of \( G \) in \( M \). The index will be the order of \( G \) divided by the order of \( M \).
\[
\frac{|G|}{|M|} = \frac{7920}{120} = 66 \text{ single cosets and we have 7 Double cosets.}
\]

9.1.1 Construction Cayley Graph

**Circle[^]**: First, we look for the first circle which is celled by \[^\] of our Cayley diagram. We note that our double coset definition changes to we have \( MwN = \{ n \in N | Mw^n \} \). Thus, our first double coset we have, \( MeN = \{ n \in N | Me^n \} = \{ e \in N | Me \} = \{ M \} \). The number of right cosets in \[^\] is equal to 1, where \( |G| = 7920 \), and \( |N| = 20 \). Since \( N \) is transitive on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40\}, so \( N \) has two orbits which are \{9, 4, 17, 12, 20, 3, 25, 28, 11, 36, 19, 35, 2, 3, 27, 10, 18, 34, 26\}, and \{5, 13, 8, 21, 16, 24, 7, 29, 32, 15, 40, 23, 39, 6, 37, 31, 14, 22, 38, 30\}. Now, we will pick element from each orbit, so we take the representative 1 of the orbit \{9, 4, 17, 12, 20, 3, 25, 28, 11, 36, 19, 35, 2, 3, 27, 10, 18, 34, 26\}, and the representative 5 of
19

So, we can figure out the orbits on generator $Mt_1$ by $\{1\}$. We note that $Mt_1 N = \{ n \in N | Mt_1^n \}$. Now we consider the coset stabilizer $M^{(1)}$, which is equal to the point stabilizer $N$

Next, we will take a representative from each orbit. Then, we will determine the orbit $Mt_1 N$ which is equal to the point stabilizer $M$. Therefore, we will have two new double cosets which are $Mt_1 N$ and $Mt_5 N$.

**Circle[1]:** We get a new double coset $Mt_1 N$, so we have the second circle which is called by $[1]$. We note that $Mt_1 N = \{ n \in N | Mt_1^n \}$. Now we consider the coset stabilizer $M^{(1)}$, which is equal to the point stabilizer $M$.

$M^{(1)} = \{ e, (1, 19)(2, 12)(3, 25)(4, 34)(5, 23)(6, 16)(7, 29)(8, 38)(9, 27)(10, 20)(11, 33)(13, 31)(14, 24)(15, 37)(17, 35)(18, 28)(21, 39)(22, 32)(26, 36)(30, 40) \}$, then the number of single cosets of $Mt_1 N$ is $\frac{|N|}{|M^{(1)}|} = \frac{20}{2} = 10$ a single coset in $[1]$. Now, we are looking at the generator $M^{(1)}$.

So, we can figure out the orbits on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40 \}$ are $\{1, 19\}, \{2, 12\}, \{3, 25\}, \{4, 34\}$, $\{5, 23\}, \{6, 16\}, \{7, 29\}, \{8, 38\}$, $\{9, 27\}, \{10, 20\}, \{11, 33\}, \{13, 31\}$, $\{14, 24\}, \{15, 37\}, \{17, 35\}, \{18, 28\}$, $\{21, 39\}, \{22, 32\}, \{26, 36\}, \{30, 40\}$

Next, we will take a representative from each orbit. Then, we will determine $\{Mt_1 t_1, Mt_1 t_2, Mt_1 t_3, Mt_1 t_4, Mt_1 t_5, Mt_1 t_6, Mt_1 t_7, Mt_1 t_8, Mt_1 t_9, Mt_1 t_{10}, Mt_1 t_{11}$, $Mt_1 t_{13}, Mt_1 t_{14}, Mt_1 t_{15}, Mt_1 t_{17}, Mt_1 t_{18}, Mt_1 t_{21}, Mt_1 t_{22}, Mt_1 t_{26}, Mt_1 t_{30} \}$ which double coset belong. As a result, $\bullet Mt_1 t_1, Mt_1 t_3, Mt_1 t_4, Mt_1 t_7, Mt_1 t_{15}, Mt_1 t_{17}$ belong to the double coset $[5]$, so the double coset $[1]$ sends 12 elements to $[5]$ since each orbit contains two elements.

$\bullet Mt_1 t_{12}$ is new double coset. Also, since $Mt_1 t_{12}$ is equal $Mt_1 t_{22}$, so we will consider them as one new double coset which we will denote by $[112]$. Thus, the double coset $[1]$ sends 4 symmetric generators to $[112]$, since $\{Mt_1 t_2, Mt_1 t_{12} \}$, and $\{Mt_1 t_{22}, Mt_1 t_{32} \}$ contain two elements. Note, we could know that $Mt_1 t_{12}$ is equal $Mt_1 t_{22}$ by using Magma code as follows:

```magma
for g in IM do
    for h in IN do
            "true"; break;
        end if;
    end for;
end for;
```

true
• $Mt_{15}, Mt_{19}, Mt_{11}, Mt_{13}$ are back to [1], so 8 elements will loop back into the double coset [1].

• $Mt_{16}$ is a new double coset which is called [16]. Also, since $Mt_{16}$ is equal $Mt_{10}$, so we will consider them as one new double coset which we will denote by [16]. Thus, the double coset [1] sends 4 symmetric generators to [16], since \{$Mt_{16}, Mt_{10}$\}, and \{$Mt_{20}$\} contain two elements.

```plaintext
for g in IM do for h in IN do if ts[1]*ts[6] eq g*(ts[1]*ts[10])^h then "true"; break;
end if; end for; end for;
```

• $Mt_{38}$ is a new double coset which is called [18]. Since $Mt_{38}$ is equal $Mt_{14}, Mt_{26}, and Mt_{30}$, so we will consider them as one new double coset which we will denote by [18]. Thus, the double coset [1] sends 8 elements to [18].

• $Mt_{18}$ is a new double coset which is called [118]. Then, the double coset [1] sends 2 symmetric generators to [118].

• $Mt_{21}$ will go to the double coset $M=[*]$ Then, the double coset [1] sends 2 symmetric generators to the double coset [*].

**Circle [5]** : Now taking a new double coset $Mt_5 N$, so we have the second circle which we call it by [5]. We note that $Mt_5 N = \{n \in N|M_5^n\}$. Now we consider the coset stabilizer $M^{(5)}$, which is equal to the point stabilizer $M_5$.

then the number of single cosets of $Mt_5 N$ is \[ \frac{|N|}{|M^{(5)}|} = \frac{20}{2} = 10 \] a single coset in [5]. Now, we are looking at the generator $M^{(5)}$. So, we can figure out the orbits on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40\} are

\[ \{1, 27\}, \{2, 36\}, \{3, 17\}, \{4, 10\}, \{5, 31\}, \{6, 40\}, \{7, 21\}, \{8, 14\}, \{9, 35\}, \{11, 25\}, \{12, 18\}, \{13, 39\}, \{15, 29\}, \{16, 22\}, \{19, 33\}, \{20, 26\}, \{23, 37\}, \{24, 30\}, \{28, 34\}, \{32, 38\}. \]

Now, we choose a representative from each orbit.

If we select \{$Mt_{5t_1}, Mt_{5t_2}, Mt_{5t_3}, Mt_{5t_4}, Mt_{5t_5}, Mt_{5t_6}, Mt_{5t_7}, Mt_{5t_8}, Mt_{5t_9}, Mt_{5t_{12}}$...
$Mt_{11}, Mt_{13}, Mt_{16}, Mt_{15}, Mt_{19}, Mt_{20}, Mt_{23}, Mt_{24}, Mt_{28}, Mt_{32}$ belong. Therefore, we could know that

- $Mt_{t1}, Mt_{t5}, Mt_{t7}, Mt_{t8}, Mt_{t15}, Mt_{t19}$ belong to the double coset [1].

So, the double coset [5] sends 12 symmetric generators to [1] since each orbit contains two elements.

- $Mt_{t2}$ and $Mt_{t16} \in$ the double coset [16].

So, the double coset [5] sends 4 symmetric generators to the double coset [16].

- $Mt_{t3}, Mt_{t9}, Mt_{t13},$ and $Mt_{t23} \in$ the double coset [5].

So, 8 elements loop back into the double coset [5].

- $Mt_{t4}, Mt_{t12}, Mt_{t28},$ and $Mt_{t32} \in$ the double coset [18].

So, the double coset [5] sends 8 symmetric generators to the double coset [18].

- $Mt_{t6} \in$ the double coset [118].

So, the double coset [5] sends 2 symmetric generators to the double coset [118].

- $Mt_{t11} \in$ the double coset $\ast$.

So, the double coset [5] sends 2 symmetric generators to the double coset $\ast=M$.

- $Mt_{t20}$ and $Mt_{t24} \in$ the double coset [112].

So, the double coset [5] sends 4 symmetric generators to the double coset [112].

**Circle [16]**: Next, we continue the same our previous processes in the new double coset which is denote by [16]. We use the definition $Mt_{t6} N = \{n \in N | Mt_{t6} n\}$. Now we consider the coset stabilizer $M^{(16)}$, which is equal to the point stabilizer $M^{16}$.

so the coset stabilizer of $Mt_{t6}$ is given by: $M^{(16)} = \{n \in N | Mt_{t6} n = Mt_{t6}\} \geq e, (1,19)(2,12)(3,25)(4,34)(5,23)(6,16)(7,29)(8,38)(9,27)(10,20)(11,33)(13,31)(14,24)(15,37)(17,35)(18,28)(21,39)(22,32)(26,36)(30,40) \geq$.

The number of single cosets in the double coset [16] is $|N|/|M^{(16)}| = 20/2 = 10$ a single coset in [16]. Now, we are looking at the generator $M^{(16)}$. So, we can see the orbits on

- $\{1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,40\}$ are

- $\{1,19\}, \{2,12\}, \{3,25\}, \{4,34\}$,
- $\{5,23\}, \{6,16\}, \{7,29\}, \{8,38\}$,
- $\{9,27\}, \{10,20\}, \{11,33\}, \{13,31\}$,
- $\{14,24\}, \{15,37\}, \{17,35\}, \{18,28\}$,
- $\{21,39\}, \{22,32\}, \{26,36\}, \{30,40\}$,
Next, we will take a representative from each orbit. Then, we will determine
\{Mt_1 t_6 t_1, Mt_1 t_6 t_2, Mt_1 t_6 t_3, Mt_1 t_6 t_4, Mt_1 t_6 t_5, Mt_1 t_6 t_6, Mt_1 t_6 t_7, Mt_1 t_6 t_8, Mt_1 t_6 t_9, Mt_1 t_6 t_{10}, Mt_1 t_6 t_{11}, Mt_1 t_6 t_{13}, Mt_1 t_6 t_{14}, Mt_1 t_6 t_{15}, Mt_1 t_6 t_{17}, Mt_1 t_6 t_{18}, Mt_1 t_6 t_{21}, Mt_1 t_6 t_{22}, Mt_1 t_6 t_{26}, Mt_1 t_6 t_{30}\} which double coset belong.

As a result, • Mt_1 t_6 t_1, Mt_1 t_3, Mt_1 t_6 t_6 belong to the double coset \[16\], so 4 elements loop back into the double coset \[16\].

• Mt_1 t_6 t_4 and Mt_1 t_6 t_{17} ∈ the double coset \[118\].

So, the double coset \[16\] sends 4 elements to the double coset \[118\].

• Mt_1 t_6 t_5, Mt_1 t_6 t_8, Mt_1 t_6 t_9, Mt_1 t_6 t_{10}, Mt_1 t_6 t_{11}, Mt_1 t_6 t_{18}, Mt_1 t_6 t_{21}, Mt_1 t_6 t_{30} belong to the double coset \[18\], the double coset \[16\] sends 16 elements to the double coset \[18\].

• Mt_1 t_6 t_7, Mt_1 t_6 t_{13}, Mt_1 t_6 t_{14}, Mt_1 t_6 t_{22} belong to the double coset \[112\], the double coset \[16\] sends 8 elements to the double coset \[112\].

**Circle**\[18\]: The fifth circle which is represented by a new double coset Mt_18 N. We note that Mt_18 N = \{n ∈ N| Mt_18^n \}. Now we consider the coset stabilizer M^{(18)}, which is equal to the point stabilizer M^{18}.

\(M^{(18)} = \{e\}\), then the number of single cosets of \(Mt_18 N\) is \(\frac{|N|}{|M^{(18)}|} = \frac{20}{1} = 20\) a single coset in \[18\]. Now, we will see at the generator \(M^{(18)}\). So, we can find the orbits on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40\} are \{1\}, \{2\}, \{3\}, \{4\}, \{5\}, \{6\}, \{7\}, \{8\}, \{9\}, \{10\}, ..., \{40\}. Next, we will determinate every orbit which double coset is belong. Then, we found that by helping Magma.

• Mt_1 t_6 t_1, Mt_1 t_8 t_3, Mt_1 t_8 t_{15}, Mt_1 t_8 t_{17}, Mt_1 t_8 t_{19}, Mt_1 t_8 t_{20}, Mt_1 t_8 t_{26}, Mt_1 t_8 t_{34} belong to the double coset \[112\], so 8 symmetric generators extend from the double coset \[18\] to \[112\].

• Mt_1 t_8 t_2, Mt_1 t_8 t_{21}, Mt_1 t_8 t_{27}, Mt_1 t_8 t_{30}, Mt_1 t_8 t_{36}, Mt_1 t_8 t_{16}, Mt_1 t_8 t_{39}, Mt_1 t_8 t_{40} belong to the double coset \[16\], so 8 symmetric generators extend from the double coset \[18\] to \[16\].

• Mt_1 t_8 t_{4}, Mt_1 t_8 t_5, Mt_1 t_8 t_{6}, Mt_1 t_8 t_{11}, Mt_1 t_8 t_{12}, Mt_1 t_8 t_{14}, Mt_1 t_8 t_{16}, Mt_1 t_8 t_{18}, Mt_1 t_8 t_{25}, Mt_1 t_8 t_{29}, Mt_1 t_8 t_{31}, Mt_1 t_8 t_{35} ∈ \[18\] , so 12 symmetric generators loop back into the double coset \[18\].

• Mt_1 t_8 t_{3}, Mt_1 t_8 t_{28}, Mt_1 t_8 t_{33}, Mt_1 t_8 t_{38} ∈ \[1\] , so 4 symmetric generators send from the double coset \[18\] to the double coset \[1\].
\[ Mt_1 t_9 t_7, Mt_1 t_8 t_{10}, Mt_1 t_8 t_{13}, Mt_1 t_8 t_{24} \in [5], \text{ so 4 symmetric generators send from the double coset } [18] \text{ to the double coset } [5]. \]

\[ Mt_1 t_9 t_9, Mt_1 t_8 t_{22}, Mt_1 t_8 t_{23}, Mt_1 t_8 t_{32} \in [118], \text{ so 4 symmetric generators send from the double coset } [18] \text{ to the double coset } [118]. \]

\textbf{Circle}[112]: The sixth double coset which labels by [112]. \( Mt_1 t_{12} N = \{ n \in N | M(t_1 t_{12}) n \} \).

Now, we will determine the coset stabilizer \( M^{(112)} \), so the coset stabilizer of \( Mt_1 t_{12} \) is given by:

\[
M^{(112)} = \{ n \in N | M(t_1 t_{12})^n = Mt_1 t_{12} \} \geq \langle e, (1,11)(2,28)(3,33)(4,18)(5,15)(6,32)(7,37)(8,22)(9,19)(10,36)(12,26)(13,23)(14,40)(16,30)(17,27)(20,34)(21,31)(24,38)(25,35)(29,39) \rangle.
\]

\( \bullet \) The number of single cosets in the double coset [112] is \( \frac{|N|}{|M^{(112)}|} = \frac{20}{2} = 10 \) a single coset in [112].

We can see that the orbits of \( M^{(112)} \) on \( \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40\} \) are

\{1, 11\}, \{2, 28\}, \{3, 33\}, \{4, 18\}, \{5, 15\},
\{6, 32\}, \{7, 37\}, \{8, 22\}, \{9, 19\}, \{10, 36\},
\{12, 26\}, \{13, 23\}, \{14, 40\}, \{16, 30\}, \{17, 27\},
\{20, 34\}, \{21, 31\}, \{24, 38\}, \{25, 35\}, \{29, 39\}.

We now take the representative from each orbit and we see where it goes. Therefore, we could know that.

\( \bullet Mt_1 t_{12} t_1, Mt_1 t_{12} t_4, Mt_1 t_{12} t_{12}, Mt_1 t_{12} t_{25} \) belong to the double coset [16].

So, the double coset [112] sends 8 elements to [16] since each orbit contains two elements.

\( \bullet Mt_1 t_{12} t_2, Mt_1 t_{12} t_3, Mt_1 t_{12} t_7, Mt_1 t_{12} t_{8}, Mt_1 t_{12} t_{14}, Mt_1 t_{12} t_{21}, Mt_1 t_{12} t_{24}, Mt_1 t_{12} t_{29} \) belong to the double coset [18].

So, the double coset [112] sends 16 symmetric generators to [18] since each orbit contains two elements.

\( \bullet Mt_1 t_{12} t_5, Mt_1 t_{12} t_{20} \) belong to the double coset [118].

So, the double coset [112] sends 4 symmetric generators to [118] since each orbit contains two elements.

\( \bullet Mt_1 t_{12} t_6, Mt_1 t_{12} t_9 \) belong to the double coset [1].

So, the double coset [112] sends 4 symmetric generators to [1] since each orbit contains two elements.
\(M_{t_1 t_{12} t_{16}}, M_{t_1 t_{12} t_{17}}\) belong to the double coset \([5]\).

So, the double coset \([112]\) sends 4 symmetric generators to \([5]\) since each orbit contains two elements.

\(M_{t_1 t_{12} t_{10}}, M_{t_1 t_{12} t_{13}} \in [112]\) So, 4 symmetric generators loop back into \([112]\).

**Circle**\([118]\): The last double coset which labels by \([118]\). \(M_{t_1 t_{18}} \mathbb{N} = \{n \in N | M(t_1 t_{18}) n\}\).

Now, we will determine the coset stabilizer \(M([118])\), so the coset stabilizer of \(M_{t_1 t_{18}}\) is given by:

\[M_{[118]} = \{n \in N | M(t_1 t_{18}) n = M(t_1 t_{18})\} \geq e, (1, 34, 11, 20)(2, 19, 28, 9)(3, 12, 33, 26)\]

- The number of single cosets in the double coset \([118]\) is \[\frac{|N|}{|M_{[118]}|} = 5\] a single coset in \([118]\).

We can see that the orbits of \(M([118])\) on \(\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40\}\) are

\{1, 34, 11, 20\}, \{2, 19, 28, 9\}, \{3, 12, 33, 26\}, \{4, 25, 18, 35\},

\{5, 38, 15, 24\}, \{6, 23, 32, 13\}, \{7, 16, 37, 30\}, \{8, 29, 22, 39\},

\{10, 27, 36, 17\}, \{14, 31, 40, 21\}.

We now take the representative from each orbit and we see where it goes. Therefore, we could know that.

- \(M_{t_1 t_{18} t_{1}}, M_{t_1 t_{18} t_{2}}, M_{t_1 t_{18} t_{6}}, M_{t_1 t_{18} t_{10}}\) belong to the double coset \([18]\).

So, the double coset \([118]\) sends 16 symmetric generators to \([18]\) since each orbit contains 4 elements.

- \(M_{t_1 t_{18} t_{3}}\) belong to the double coset \([5]\).

So, the double coset \([118]\) sends 4 symmetric generators to the double coset \([5]\) since each orbit contains 4 elements.

- \(M_{t_1 t_{18} t_{5}}\) belong to the double coset \([1]\).

So, the double coset \([118]\) sends 4 symmetric generators to \([1]\) since each orbit contains 4 elements.

- \(M_{t_1 t_{18} t_{8}}, M_{t_1 t_{18} t_{14}}\) belong to the double coset \([16]\).

So, the double coset \([118]\) sends 8 symmetric generators to \([16]\) since each orbit contains 4 elements.

- \(M_{t_1 t_{18} t_{4}}, M_{t_1 t_{18} t_{7}}\) belong to the double coset \([112]\).
So, the double coset $[118]$ sends $8$ symmetric generators to $[112]$ since each orbit contains $4$ elements.

Finally, we could complete our Cayley diagram of $M_{11}$ over Maximal Subgroup $S_5$.

$$|G| \leq (|M| + \frac{|N|}{|M|^{(1)}} + \frac{|N|}{|M|^{(5)}} + \frac{|N|}{|M|^{(16)}} + \frac{|N|}{|M|^{(18)}} + \frac{|N|}{|M|^{(112)}} + \frac{|N|}{|M|^{(118)}}) \times 120$$

$$|G| \leq (1 + 10 + 10 + 10 + 20 + 10 + 5) \times 120$$

$$|G| \leq (66 \times 120) \leq 7920$$

Figure 9.1: Cayley Graph of $M_{11}$ over Maximal Subgroup $S_5$
9.2 Double Coset Enumeration of $U(3, 5)$ over Maximal Subgroup $A_7$

We will apply manual double coset enumeration of $U(3, 5)$ over $M \cong A_7$. Consider the group $G = \frac{S_5^m \times S_3}{(y^{x^2} s t)^4, (y^{x^2} s t^2)^7}$. A symmetric presentation of $G$ is $G = \langle x, y, t | x^5, y^2, (x^{-1} y)^4, (x y x^{-2} y x)^2, t^5, (t y x^{-1} y), t^{(x y x^{-2})} = t^4, (y^{x^2} s t (y^{x^2}))^4, (y^{x^2} s t^2)^7 \rangle$. Where the order of the group $|G| \cong |U(3, 5)| = 126000$ and $|N \cong S_5| = 120$.

We now find a suitable maximal subgroup that contains $N$ for performing the maximal double coset enumeration of $U(3, 5)$ over $M$ and $N$. First, we have to find the maximal subgroup as follows:

\begin{verbatim}
M := MaximalSubgroups(G1);
M;
Conjugacy classes of subgroups

[1] Order 240 Length 525
Permutation group acting on a set of cardinality 1050
Order = 240 = 2^4 * 3 * 5

[2] Order 1000 Length 126
Permutation group acting on a set of cardinality 1050
Order = 1000 = 2^3 * 5^3

[3] Order 720 Length 175
Permutation group acting on a set of cardinality 1050
Order = 720 = 2^4 * 3^2 * 5

[4] Order 720 Length 175
Permutation group acting on a set of cardinality 1050
Order = 720 = 2^4 * 3^2 * 5

[5] Order 720 Length 175
Permutation group acting on a set of cardinality 1050
Order = 720 = 2^4 * 3^2 * 5

[6] Order 2520 Length 50
Permutation group acting on a set of cardinality 1050
Order = 2520 = 2^3 * 3^2 * 5 * 7

[7] Order 2520 Length 50
Permutation group acting on a set of cardinality 1050
Order = 2520 = 2^3 * 3^2 * 5 * 7

[8] Order 2520 Length 50
Permutation group acting on a set of cardinality 1050
Order = 2520 = 2^3 * 3^2 * 5 * 7
\end{verbatim}
To find all maximal subgroup of G by $\frac{|M|}{|N|}$. In order to determine which subgroup contains N, we will use this following Magma code:

```
C:=Conjugates(G1,M[8]'subgroup);
CC:=Setseq(C);
for i in [1..#CC] do if f(x) in CC[i] and f(y) in CC[i] then i; end if; end for;
```

So, we will use this M[8]'subgroup. In appendix, we can see how we could find the relation which will create M.

Thus, our $M \cong A_7$ and its order is 2520. Also, we have 5 double cosets and 50 single cosets.

```
M:=sub<G|x,y,t*x*t^-1>;
#M;
2520
#DoubleCosets(G,M,sub<G|x,y>);
5
IM:=sub<G1|f(x),f(y),f(t*x*t^-1)>;
CompositionFactors(IM);
G
| Alternating(7)
1
#G/#M;
50
```

Now, we can begin our method to find the double coset enumeration of $U(3,5)$ over the maximal subgroup $A_7$ as our previous example.

**The first double coset** which is labeling by [*] in our Cayley diagram. We have that our double coset definition is $MwN = \{n \in N|Mw^n\}$. Thus, our first double coset we have, $MeN = \{n \in N|Me^n\} = \{e \in N|Me\} = \{M\} = [*]$.

The number of right cosets in [*] is equal to 1, where $|G| = 126000$, and $|N| = 120$.

Since $N$ is transitive on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24\}. So, N has one orbit which is

\{1, 6, 3, 11, 5, 4, 12, 22, 2, 8, 17, 20, 7, 10, 18, 19, 16, 9, 14, 23, 24, 21, 13, 15\}.

We now take element from the orbit, so we take the representative 1 of the orbit

\{1, 6, 3, 11, 5, 4, 12, 22, 2, 8, 17, 20, 7, 10, 18, 19, 16, 9, 14, 23, 24, 21, 13, 15\} Therefore, we will
have one new double coset which is $Mt_1N$.

**The second double coset** which is labeling by [1] in our Cayley diagram. We note that $Mt_1N = \{ n \in N | Mt_1^n \}$. Now we consider the coset stabilizer $M^{(1)}$, which is equal to the point stabilizer $M^1$.

$M^{(1)} = \{ e, (2, 16, 21, 23, 6)(3, 5, 12, 8, 22)(4, 9, 11, 18, 14)(10, 15, 17, 24, 20) \}$, then the number of single cosets of $Mt_1N$ is \( \frac{|N|}{|M^{(1)}|} = \frac{120}{60} = 2 \) a single coset in [1].

Now, we are looking at the generator $M^{(1)}$.

So, we can see the orbits on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24 \}$ are $\{1, 6, 11, 4, 2, 18, 16, 9, 14, 23, 21, 13 \}$ and $\{3, 12, 20, 17, 22, 7, 19, 10, 24, 8, 5, 15 \}$.

Next, we will take a representative from each orbit. We could determine that.

- $Mt_1t_1 \in [1]$ is the new double coset.

So, the double coset [1] sends 12 symmetric generators to the new double coset [11].

- $Mt_1t_3 \in [\ast]$.

So, the double coset [1] sends 12 symmetric generators to the double coset $[\ast]$.

**The third double coset** which is labeling by [11] in our Cayley diagram. We want to indicate that $Mt_1t_1N = \{ n \in N | Mt_1^n \}$ and the coset stabilizer $M^{(11)}$, which is equal to the point stabilizer $M^{11}$.

$M^{(11)} = \{ e, (2, 16, 21, 23, 6)(3, 5, 12, 8, 22)(4, 9, 11, 18, 14)(10, 15, 17, 24, 20) \}$, then the number of single cosets of $Mt_1t_1N$ is \( \frac{|N|}{|M^{(11)}|} = \frac{120}{10} = 12 \) a single coset in [11].

Now, we can see the orbits on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24 \}$ are $\{1, 13\}$, $\{7, 19\}$, $\{2, 6, 4, 14, 18, 9, 11, 23, 16, 21\}$, and $\{3, 22, 24, 17, 15, 20, 10, 8, 5, 12\}$.

Next, we will take a representative from each orbit, so we will pick 13 from the orbit $\{1, 13\}$, 7 from the orbit $\{7, 19\}$, 2 from the orbit $\{2, 6, 4, 14, 18, 9, 11, 23, 16, 21\}$, and 3 from $\{3, 22, 24, 17, 15, 20, 10, 8, 5, 12\}$. Then, we can determine that.

- $Mt_1t_1t_{13} \in [11]$.

So, 2 symmetric generators loop back into the double coset [11]. We could figure this out by the following Magma code:

```magma
for g in IM do
   for h in IN do
      if ts[1]*ts[1]*ts[13] eq g*(ts[1]*ts[1])^h then "true"; break;
   end for;
end for;
```
end if; end for; end for;
true

• $M_1t_1t_7 \in [11]$. So, 2 symmetric generators go to the double coset [1].

for g in IM do for h in IN do if ts[1]*ts[1]*ts[7] eq g*(ts[1])^h then "true"; break; end if; end for; end for;
true

• $M_1t_1t_2 \in [112]$ this is a new double coset. So, 10 symmetric generators send from the double coset [11] to the new double coset [112].

• $M_1t_1t_3 \in [113]$ this is a new double coset. So, 10 symmetric generators send from the double coset [11] to the new double coset [113].

The forth double coset which is labeling by [112] in our Cayley diagram. We can see that $M_1t_1t_2N = \{ n \in N | M_1t_1t_2^n \}$ and the coset stabilizer $M^{(112)}$, which is equal to the point stabilizer $M^{112}$. $M^{(112)}=\{ e, (1,20)(2,7)(3,6)(4,17)(5,16)(8,13)(9,12)(10,23)(11,22)(14,19)(15,18)(21,24) \}$, then the number of single cosets of $M_1t_1t_2N$ is

\[
\frac{|N|}{|M^{(112)}|} = \frac{120}{4} = 30 \text{ a single coset in [112]}. 
\]

Now, we can see the orbits on $\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24 \}$ are $\{1, 20, 8, 13\}, \{2, 7, 19, 14\}, \{3, 6, 4, 17\}, \{5, 16, 18, 15\}, \{9, 12, 10, 23\}, \{11, 22, 24, 21\}$. We will pick a representative from each orbit, so we determine that.

• $M_1t_1t_2t_1 \in [11]$. So, 4 symmetric generators send from the double coset [112] to the double coset [11].

for g in IM do for h in IN do if ts[1]*ts[1]*ts[2]*ts[1] eq g*(ts[1]*ts[1])^h then "true"; break; end if; end for; end for;
true

• $M_1t_1t_2t_2, M_1t_1t_2t_3, M_1t_1t_2t_5, M_1t_1t_2t_9$, and $M_1t_1t_2t_{11} \in [112]$. So, 20 symmetric generators loop back into the double coset [112].

for g in IM do for h in IN do if ts[1]*ts[1]*ts[2]*ts[2] eq g*(ts[1]*ts[1]*ts[2])^h then "true"; break; end if; end for; end for;
for g in IM do for h in IN do if ts[1]*ts[1]*ts[2]*ts[3]
eq g*(ts[1]*ts[1]*ts[2])^h then "true"; break;
end if; end for; end for;
true

The last double coset which is labeling by [113] in our Cayley diagram. We can see that $Mt_1t_3N = \{n \in N | Mt_1t_3^n\}$ and the coset stabilizer $M^{(113)}$, which is equal to the point stabilizer $M^{(1)}$.

then the number of single cosets of $Mt_1t_3N$ is $\frac{|N|}{|M^{(113)}|} = \frac{120}{24} = 5$ a single coset in [113].

Now, the orbit on \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24\} is \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24\}.

We will pick a representative from the orbit, so we determine that.

• $Mt_1t_3t_1 \in [11]$. So, 24 symmetric generators send from the double coset [113] to the double coset [11].

Finally, we conclude that our Cayley diagram of $U(3, 5)$ over maximal subgroup $A_7$.

$$|G| \leq (|M| + \frac{|N|}{|M^{(1)}|} + \frac{|N|}{|M^{(11)}|} + \frac{|N|}{|M^{(112)}|} + \frac{|N|}{|M^{(113)}|}) \times 2520$$

$$|G| \leq (1 + 2 + 12 + 30 + 5) \times 2520$$

$$|G| \leq (50 \times 2520) \leq 126000.$$
