ABSTRACT

Pocket PC handheld computers are particularly useful for retrieving and storing information for people who are on the move and have busy fast changing schedules. Contacts, upcoming appointments, and brief notes are readily available. Like other professions in the world, there is a need to have a software system to give hospital doctors easy access to up-to-date operating information via wireless device.

The Prescription Express (PE) system is a software package that is developed with the express service of health care in mind. The purpose of this software package is to provide an environment in which doctors can easily checking on the upcoming appointments with patients and convenient to make prescription via wireless network or Internet/Intranet; nurses can maintain patient information, appointment, and the status of the prescription order; pharmacists can convenient to receive via Internet/Intranet and begin to fill up the drug. Utilizing the Microsoft eMbedded Visual tools to create application and system components for the Pocket PC and its wireless connection. In addition, utilizing the object oriented Java language to develop Java Server Pages and Servlets for Internet/Intranet connection. The PE system provides
the doctors, nurses, and pharmacist an effective method of communication.

By switching over to computerized documentation and wireless or online prescription processing, the clinical practice will be more efficient and the patient will have more resting time for the healing. The PE system eliminates medical errors resulting from misinterpreted handwriting. In addition, the system will provide the patients with easy express services without carrying paper prescription and making multiple trips to the pharmacy department.
ACKNOWLEDGMENTS

First, I would like to express my special gratitude to my project advisor Dr. Botting, whose valuable guidance and suggestions makes my project a whole. And thanks to my two project committee professors Dr. Gomez and Dr. Voigt for their strong support in developing this project.

Second, I would like to express my appreciation to my family. Thanks to my parents, witnessing my interest in pursuing higher education and encouraging my motivation to achieve my "American Dream" in US. Their encouragement and patience make my education possible, for it was they who bought my first computer.

Lastly, I want to thank everyone else who has helped me with, shown me the way on, or given me the opportunity in the software development. From online newsgroups and servers to good friends at school, it takes a great environment to make a great programmer.

CHAPTER ONE
SOFTWARE REQUIREMENTS SPECIFICATION

1.1 Introduction

Pocket PC handheld computers are particularly useful for retrieving and storing information for people who are on the move and have busy fast changing schedules. As those small computers become more powerful with every generation, the possibly of their being really useful in a meaningful way is also increasing. Many analyzers suggest that more than 25% [13] and up to 40% [11] of all physicians in the US are using some form of a Personal Digital Assistant (PDA). The most recent 2002 HIMSS/AstraZeneca Clinician Wireless Survey [8] looked at how physician practices used information technology (IT) such as the use computer, handheld devices, electronic medical record and future purchasing decision, and found that 98% of hospital has Internet access, 72% of doctors use handheld devices, 70% of physicians used handhelds as a reference on pharmaceuticals before prescribing drugs for patients, 41% of doctors used handhelds for patient scheduling, 28% of hospitals use electronic medical records, and 21% of doctors exchange e-mail with their
patients. The number of physician who uses IT in the practice of medicine is increasing.

Many analyzers predicts that by 2004 more than half of all US physicians will be using some form of a handheld device for everything from scheduling to data collection, to prescribing to decision support [10]. This will make handheld devices one of the fastest growing technologies ever adopted by physicians. Currently, most physicians use PDA as a portable drug reference resource and scheduling. As the number of health related applications available for PDA has skyrocketed, there is a need to have a hospital software system which can provide hospital doctors easy access to keep appointment schedule, make prescription, and maintain up-to-date operating information via PDA.

This project presents the Prescription Express (PE) system which aims at the exploitation of the wireless network of Pocket PC and wired network of the server and the clients within different departments of a hospital. Within the PE system, the nurse will schedule daily patient appointment from the desktop computers at the nurse station. After the doctor exam the patients, instead of scrawling the prescription on a piece of paper, the doctor enters it into a computer or mobile device at the office. From there, it can be printed out on a local printer and
automatically routed to hospital pharmacy department, so the medicine is ready for the patient when they stop by.

The primary request of the doctor for use PDA is to answer questions that occur at the point-of-care. Due to the restrictions on size, memory and viewable screen, PDAs are limited in their ability to provide traditional content in traditional ways. Therefore, it is important to integrate the software for PDA with the familiar content and sources clinicians use daily [13]. Many companies have attempted use the power of the PDA in the emerging field of "Electronic Prescribing"; those companies include PocketScript, ePhysician ePad, and AllScripts [7]. Those three companies develop their systems somewhat differently. PocketScript and AllScripts both use Microsoft Pocket PC system hand-held device and implement a wireless local area network in the physician’s office to move information from the hand-held device to a desktop computer server in the physician’s office. Then the server is connected to the vendor’s computer through a modem or other high-speed access device to get drug information updates. Later, the office computer also sends prescriptions directly to pharmacies either as an electronic message or by fax. However, ePhysician implemented on the Palm OS based system hand-held device and uses a personal computer in
the physician’s office to load patient demographic information onto the hand-held using a docking cradle. Then the prescriptions must send directly to a central computer server at the vendor’s offices, and then the Vendor’s computer will sends prescriptions to the selected pharmacy, either electronically or by fax. Those three systems function in the environment where the doctor office and the pharmacy store are not in the same hospital. However, the PE system integrates the systems for the doctor office, nurse station, and pharmacy department for one same hospital. The PE system uses sophisticated encryption to protect the confidentiality of data as it is sent between computers in the same hospital.

The PE system that does nothing other than produce legible prescriptions in a shorter time than it would take to write one by hand can benefit many physicians. The PE system would provide an accurate record of previous prescriptions that allows the rapid renewal of multiple prescriptions is even more valuable. Another important potential benefit of an electronic prescribing system is fewer errors, including those caused by illegible handwriting, incorrect dosage selections, drug-drug or drug-disease interactions, and drug allergies. In 2000, the Institute of Medicine (IOM) published a report which
stunned the medical community [9]. The IOM report stated that medical errors are one of the nation’s leading causes of death and injury and estimated that as many as 44,000 to 98,000 people die in U.S. hospitals each year as the result of medical errors. This means that more people die from medical errors than from motor vehicle accidents, breast cancer, or AIDS [12]. The good news is that many medical errors are preventable, such as the medical errors resulting from misinterpreted handwriting prescription. The PE system will eliminate the risk of medical misadventure due to illegible prescriptions by switching the paperwork to electronic medical records.

The contents of Chapter one presents an overview of the project. The contexts of the problem are discussed followed by the purpose, significance of the project, and assumptions. Next, the limitations that apply to the project are reviewed. Finally, definitions of terms are presented.

1.2 Purpose of the Project

The goal of this Master’s projects is to build the PE system. The PE system is developed with the express service of health care in mind. The express service is mainly for outpatient with the need of behind counter
prescription care. Currently clinics still use a paper filing system for medication prescription that is relatively inefficient and takes up valuable storage space. In addition, most patients will need to go to the pharmacy store with the paper prescription to order and wait for their medication. This is relatively inconvenient and takes up valuable time. By switching over to computerized documentation and wireless or online prescription processing, the clinical practice will be more efficient and the patient will have more time for healing.

This system will enable the registered hospital doctors to write up a prescription via a handheld device. The prescription can be printed out and save in the central secured hospital server via a wireless network. In addition, the system can also transmit the prescription order to the hospital’s pharmacy store. The pharmacy store will immediately process the order and respond back to the medical doctor with a confirmation and the medication pickup time. This system eliminates medical errors resulting from misinterpreted handwriting. In addition, the system will provide the patients with easy express services without carrying paper prescription and making multiple trips to the pharmacy department.
The PE system will enable the medical doctors to share with the pharmacy store appropriate patient information such as allergies and insurance information. So the pharmacists can meet their obligation in dispensing medications that suits a patient; this will lower incidence of in-pharmacy drug switching. Information exchanged is solely for the purposes of professional medical and pharmacy practice.

1.3 Context of the Problem

There are two aspects of the problem encountered in the development of PE system. The first aspect related to the database management and the second relates to the security issue of communication and data transaction.

First, given the number of registered hospital employee, patient, exam records, and prescription orders each day being maintained by the PE system, it is evident that careful database management must occur to ensure the appropriate utilization of the system resources to satisfy the objective and requirement of the daily hospital work loads. Further, the PE system must ensure a separate backup and recovery or maintenance functions for the database being undertaken. All contents and logs shall be generated dynamically and automatically so no human
interaction is needed. The server shall be up twenty-four hours a day and seven days a week, with exception that periodical system maintaining needs to be conducted depending on the reliability of the system server. The system should handle network packet loss smoothly. The system should not save inconsistent data or incomplete data into database.

Second, the issues related to the security issue. The Wireless communication security and the Pocket PC security have arisen recently.

Questions about cellular communication security go way back to the beginning of cell phones. Traditional Cellular communications use analog signals which are relatively easy to intercept and decode. However, the current digital wireless communications would solve all those problems. Because of the compressed nature of digital data and the improved encryption technologies, digital signals are much more difficult to be intercepted. Digital communication can access to secure private connections anywhere and anytime.

The web browser such as Internet Explorer supports accessing Web sites with 128-bit encryption using PCT (Private Communications Technology) and (Secure Sockets Layer) SSL protocols. While this sounds like it should
work great to access the web, but the Web browser must be version 4.0 or later. Because Pocket Internet Explorer only matches version 3.02, most secure Web sites do not allow the Pocket PC users to access them. Hence, the PE system must generate an application using the VPN service on the web server and to ensure the security of access.

1.4 Significance of the Project

The significance of the project was the implementation of wireless technology in today's fast paced health care field. This project attempted to use the power of the Pocket PC in the emerging field of electronic prescribing. Instead of scrawling the prescription on a piece of paper, the doctor enters the prescription order into a Pocket PC at anywhere or a desktop at the office. From there, the prescription can be printed out on a local printer and automatically routed to the hospital. Among other advantages, this project will reduce the risk of medical misadventure due to illegible hand wrote prescriptions.
1.5 Assumptions

The following assumptions were made regarding the project:

1. All users have experiences with Microsoft operation system.
2. All users have basic experience with Internet communication and browser usage.
3. All doctors have some experience with the usage of Pocket PC.

1.6 Limitations

During the development of the project, a number of limitations were noted. One of the limitations is that PDAs are limited in both memory and screen size. PDAs are designed to work with, rather than replace, laptop and desktop computers. PDAs generally do not have hard drives, but store programs and information in memory. This has the advantage that with a PDA, the programs do not need to be loaded into memory when the PDA turns on, but are instantly available. The disadvantage is that with current technology there is a limit to memory space, so the operating systems, programs and data are all sharply reduced from what might run on a full-sized computer.
Another limitation is that Microsoft includes a VPN client for connecting the Pocket PC to a VPN running on a Windows NT or Windows 2000 Server. Microsoft’s VPN client does not provide support for other servers or routers that offer VPN connectivity. Due to this limitation, the hospital server must running on a Windows NT or Windows 2000 Server.

The other limitation is that the Pocket PC user could not access the PE system through Pocket Internet Explorer. The Pocket Internet Explorer only matches version 3.02 which does not support 128-bit encryption. Due to this limitation, the PE system implements the VPN client component in the Pocket PC to access the VPN hospital server.

1.7 Definition of Terms

The following terms are defined as they apply to the project.
Table 1. Definition of Terms

<table>

1.8 Organization of the Report

This report is divided into five chapters. Chapter one provides software requirements specification, an introduction to the context of the problem, purpose of the project, significance of the project, limitations, and definitions of terms. Chapter Two consists of the software design. Chapter Three documents the steps used in testing the project. Chapter Four presents the users manual from the project. Chapter Five presents conclusions drawn from the development of the project. The Appendices containing the project follows Chapter Five. Finally, the references for the project are presented.
CHAPTER TWO
SOFTWARE DESIGN

2.1 Introduction
The PE system consists three parts, one is the application for wireless handheld device, the Internet based hospital server, and desktop application for the reception counter and pharmacy department. The applications for wireless handheld device will consist of all available drugs carried by the hospital's pharmacy department, menu/list of appointments, patient information menu, drug reference, and prescription menu. However, the drug reference menu will not be developed in this project. There are quiet a few good drug reference software systems on the market. Every morning, the doctor will need to load the appointment list and patient information into his/her PDA with the cradle. After each examine, the patient prescription data will process to the hospital server from the wireless handheld device. All information that is exchanged with the hospital provider over the Internet is encrypted with 128-bit SSL technology. 128-bit SSL is the standard for commercial usage, which will provide the highest level of available encryption when sending and receiving data over the Internet and protects information
from interception and hacking. The implement of Pocket PC 2002 edition offers the power on password, usage of VPN (Virtual Private Network), and access Web sites that support 128-bit encryption or e-mail security. In addition to the application security measures of the handheld device, important information, such as patient names are always encrypted on the handheld device and the patient social security number will be substituted with arbitrary number. The main operations requirement for the hospital server is that it must be available 24 hours a day, 7 days per week. All actions are user initiated. Separate backup and recovery or maintenance functions are required as that is handled by system administration on the hospital hosting server machine. The database will also managed by the full time system administrator of hospital.

2.2 System Design

2.2.1 Overall Schema

The PE system can be divided into three parts. One is the application for handheld device, the other is the central secured hospital server, and the last one is the computers at the doctor office, nurse station, and pharmacy department. The hospital will be require to wired all its examine room with wireless access points, using
wireless Ethernet 802.11(b). By using the 802.11b wireless protocol, the wireless LAN modules can be attached to the PDAs to provide Internet connectivity to the hospital server.

2.2.2 State Diagram

A State diagram is an analysis tool that can be used when a system or component of a system passes through a series of discrete states during operation. The following provides a state transaction diagram for the patients.
Figure 2. State Diagram for the Patients

The following provides a state transaction diagram for the prescription flow.

Figure 3. State Diagram for the Prescription
2.2.3 Product Functions

The following provides a Use Case Diagram that graphically depicts the users and principal functions of the PE. Further description of the functionality of the product is further described in section 2.2.3.1 to 2.2.3.4.

Figure 4. Use Case Diagrams
2.2.3.1 Functions for Doctors. The functions provided in the section are for all registered medical doctors who are an employee in the hospital. Further description of the functionality of the product for doctor is further described in section 2.2.3.1.1 to 2.2.3.1.5.

2.2.3.1.1 View Drug Information. Each doctor can use the system as a drug reference book. This function will assist to make a professional prescribing decision.

2.2.3.1.2 View Patient Information. Each doctor can view the patient information and medical history before making any professional prescribing decision.

2.2.3.1.3 View Prescription Orders. Each doctor can view the prescription orders that he or she made.

2.2.3.1.4 Update/Delete Prescription Orders. Each doctor can modify the prescription orders that he or she made while the prescription is not being process.

2.2.3.1.5 Make Prescription.

Step 1: Write up prescription

Doctor uses the PDA to write up a prescription scenario.

Step 2: Send prescription

Doctor sends the patient’s prescription to the hospital’s pharmacy department and orders the medication with the patient’s agreement.
Step 3: Print prescription

Doctor prints out the patient’s prescription.

Step 4: Save prescription

System saves the patient’s prescription to the central hospital secured server. The information will save in the patient’s medial history. This will also assist the hospital in searching patients for any medication call back.

2.2.3.2 Functions for Pharmacists. The PE system provides functions to let the pharmacists to assist the patients with better and express service. Further description of the functionality of the product for pharmacist is further described in section 2.2.3.2.1 to 2.2.3.2.4

2.2.3.2.1 View Drug Information. Each pharmacist can use the system as a drug reference book. This function will assist to make a professional prescribing decision.

2.2.3.2.2 View Patient Information. Each pharmacist can view the patient information and medical history.

2.2.3.2.3 View Prescription Orders. Each pharmacist can view all prescription orders that are not been fulfilled.
2.2.3.2.4 Modified Prescription Order Status. The pharmacist will able to modify the prescription ordering status upon the completion.

2.2.3.3 Functions for Administrators. The functions provided in the section are for the administrator to create a secured network environment in the hospital. Further description of the functionality of the product for administrator is further described in section 2.2.3.3.1 to 2.2.3.3.2

2.2.3.3.1 Create User Account. The administrator will create accounts for all professional medical doctors who have the privileges and the license to write prescription and currently working in the hospital.

2.2.3.3.2 Update/Delete User Account. The administrator can modify user account.

2.2.3.4 Functions for Nurses. The functions provided in the section are for the nurses to assist patients. Further description of the functionality of the product for nurse is further described in section 2.2.3.4.1 to 2.2.3.4.5

2.2.3.4.1 View Prescription Status. The nurse will require to login in order to check the automatic scheduled medication pick-up time for each patient. The nurse can check the prescription ordering status for each patient.
2.2.3.4.2 Create New Patient Account. The nurse will be required to gather patient information and inputting them into the system.

2.2.3.4.3 Update/Delete Patient Information. The nurse will be able to update patient information.

2.2.3.4.4 Make Appointment. The nurse will be able to make an appointment for the patient by scheduling the date and time according to the doctor's office hours.

2.2.3.4.5 Update/Delete Appointment. The nurse will be able to update or delete an appointment in the patient's request.

2.3 System Environment

The PE system uses the following hardware. To use the PE system, the hospital server computer should meet or exceed the following requirements:

- Windows® compatible PC
- Pentium® IV 1.5 GHz (1 GHZ or better recommended)
- 256MB RAM minimum
- 150MB available hard disk space
- Windows® 2000 Server, or Windows NT® 4.0
- Microsoft Internet Explorer 5.5 or newer
- CD-ROM drive
• Printer
• 15" monitor with 800x600 resolution (or better)

To use the PE system, the handheld device should meet or exceed the following requirements:

• Approved Brands: Compaq, Hewlett-Packard, Casio, and others
• Operating System: Windows ® CE pocketPC2002
• Memory: 64MB of memory is strongly recommended, however 32MB handheld can run portions of the PE system.

To use the PE system, the wireless connectivity between the handheld device and hospital server computer should meet or exceed the following requirements:

• Instant Wireless Network Access Point
• Fully IEEE 802.11a & 802.11b compatible
• High speed transfer rate up to 22 Mbps in 2.4 GHz or 72 Mbps in 5GHz
• A Range of operation of up to 1600 feet
• Hardware router and advanced firewall
• 128-bit Encryption
The PE system uses the following software for developing:

- Jakarta Apache Tomcat 4.0.3
- Microsoft Server 2000 Driver for JDBC
- JDK Development Kit 1.4.0
- Microsoft SQL Server 2000 Window CE Edition
- Microsoft SQL Server 2000 Enterprise Edition
- Microsoft eMbedded Visual Tools 3.0
- Microsoft Windows 2000 Server
- Internet Explorer web browser

2.4 Database Design

The database design of the PE system is developed and normalized based upon the prescription writing modules of Department of Pharmacology and Experimental Therapeutics Tufts University School of Medicine [5]. A hospital has many employee and patients. Each employee has a unique employee ID, user ID, and password. The EMPLOYEE table will store each employee's employee ID, user ID, password, name, phone number, address, department, employee type, and social security number. Each doctor has many patients. Each patient has a unique arbitrary ID number. The PATIENT table will store each patient's ID, name, phone number, social security number, email, address, sex, age, height,
weight, and medical history. The patient will be required to make an appointment to see a doctor. The APPOINTMENT table will consist of appointment's ID, time, date, doctor's ID, and patient's ID. The doctor will meet and examine the patient at the appointment time. Each EXAM table will consist of doctor's ID, patient's ID, date, exam notes, and exam's ID. Each exam will order prescriptions. The PRESCRIPTION table will store the prescription ID, drug name, drug dose and unit, quantity to dispense, drug usage, substitution for other drugs, ordered time, number of medication refill, the ordering status, doctor's ID, patient's ID, exam's ID, and pharmacist's ID. The DRUG table will consist of the most commercial drugs in the market, their names, treatment, indication information, units, favorite, and the availability in pharmacy department of the hospital.
2.4.1 Database Entity Relationship

Figure 5. Entity Relationship Diagram
2.4.2 Conceptual Database Model

Figure 6. Conceptual Model Diagram
2.4.3 Logical Model Table Schema

The database dictionary of the PE system is presented in the following.

Table 2. Database Dictionary for Table EMPLOYEE

<table>

CHAPTER THREE
SOFTWARE QUALITY ASSURANCE

3.1 Introduction

This chapter defines and controls the quality of the PE System by defining the techniques, procedures, processes and standards that will be used to develop the final prototype. The final prototype will be checked for conformance to the functional and performance requirements.

3.2 Unit Test Plan

The Unit Test Plan for the final PE System Prototype instructs a tester, what tests to perform on each module in the system. A module is a component of the system, which may be defined by a project to be implemented as a procedure, function, class, or program. The Unit Test Plan objective is to ensure that the particular module under test works properly and performs all the desired functions. Interaction between modules and overall system performance is not tested during this phase. The operation of each module function is tested and the results of the tests are summarized in Table.

3.3 Integration Test Plan

Integration Test Plan for the final PE System

Prototype verifies that the software is functioning accordingly to the design as specified in chapter two. Each test is composed of a series of steps. Each step will be executed in sequence. The tester will initial or sign each step as it is completed. If the step is completed successfully, then it will be indicated as such in the test report. The operation of each series of steps is tested and the results of the tests are summarized in Table.
<table>

4.1 Introduction

Included in Chapter Four was a presentation of the user's manual of the project. The manual consists of two parts, one for Pocket PC user and one for web browser user.

4.2 Pocket Personal Computer (PC) User

4.2.1 Login Screen

The doctor will be shown a login screen, which will require the login name and encrypted password. This page will ensure the identification of the doctor for the security reason. Login into the PE system will allow the appointment screen, the prescription list screen, the prescription form screen, and the drug list screen to be activated.
4.2.2 Appointment Screen

This screen will show the list of login doctor’s appointments of the day. Upon clicking on the appointment, the prescriptions of the selected patient will be shown in the prescription list screen and the patient ID will be automatic loaded in the prescription form screen.
4.2.3 Prescription Ordered List Screen

The screen will show the list of login doctor’s ordered prescription of the day for the selected patient. Upon clicking on the prescription, the complete prescription information will be automatic loaded in the prescription form screen for any further modification and update.
4.2.4 Prescription Form Screen

The screen will allow the doctor to order prescription. Upon clicking on the 'Whole List', the complete drug list will be shown; clicking on the 'Favorite', the complete favorite drug list will be shown. After selection of the drug, the doctor can select the dispense quantity, substitute, and the times of refill.
4.2.5 Drug List Screen

The screen will present the complete list of drug. The drug must be selected first, then the doctor can bookmark/delete/reset his/her favorite drug from the drug list.
Figure 11. Pocket PC Drug List Screen

4.2.6 Exit Screen

Clicking the exit screen will exit the program.

4.3 Web Browser User

4.3.1 Home Page

Home page is the main web page of the PE system, which allows employee to access to the login page by clicking the hyperlink.
4.3.2 Login Page

The hospital employee will be shown a login page, which will require the login name, and encrypted password. This page will ensure the identification of the employee for the security reason. After password validation, the employee will access to their individual type menu page.
4.3.3 Doctor Main Menu Page

The main menu provides doctor access to detailed pages via a menu.
4.3.4 View Drug Information Page

This page allows the doctor/pharmacist to view selected drug information.

![View Drug Information Page](image)

**Figure 15.** View Drug Information Page

4.3.5 Doctor View Appointment Page

This page will show the list of login doctor's appointments of the day.
Figure 16. Doctor View Appointment Page

4.3.6 Doctor View Patient Information Page

This page will allow the doctor/pharmacist to view the selected Patient Information. This page will allow the doctor to search and select the individual patient. After the selection of the patient, the doctor will be able to access patient information by hyper linking to the 'View Patient Information Page'.
4.3.7 Doctor Make Prescription Page

This page will allow the doctor to make prescription. First, the doctor needs to select the medication. After the selection of the medication, the doctor will able to access prescription form by hyper linking 'select' to the Prescription Foam Page.
Figure 18. Prescription Foam Page

4.3.8 Doctor View Prescription Records Page

This page will allow the doctor to view all ordered prescriptions of the day. The doctor can further select the prescription and modifying the ordering by hyper linking to the 'Modify Prescription Record Page'.
4.3.9 Nurse Main Menu Page

The main menu provides nurse access to detailed pages via a menu.

Figure 19. Prescription Records

Figure 20. Nurse Main Menu Page
4.3.10 Nurse Create New Patient Page

This page allows the nurse to create new patient.

![Create New Patient Page](image)

Figure 21. Create New Patient Page

4.3.11 Nurse Update Patient Information Page

This page will allow the nurse to search and select the individual patient. After the selection of the patient, the nurse will be able to access and update patient information by hyperlinking to the 'Update Patient Information Page'. Then nurse to update patient information.
4.3.12 Nurse Create New Appointment Page

This page will allow the nurse to search the filled appointment of the individual doctor and create new appointment.

Figure 22. Update Patient Information Page

Figure 23. Create New Appointment Page
4.3.13 **Nurse Update Appointment Information Page**

This page will allow the nurse to search and select the made appointment and update the made appointment information.

![Image of Update Appointment Information](image)

**Figure 24. Update Appointment Page**

4.3.14 **Nurse View Prescription Status Page**

This page will allow the nurse to select and view the prescription status of individual patient.
Figure 25. View Prescription Status Page

4.3.15 Pharmacist Main Menu Page

The main menu provides pharmacist access to detailed pages via a menu.

Figure 26. Pharmacist Main Menu Page
4.3.16 Pharmacist View Prescription List Page

This page will allow the pharmacist to view all prescription orders which are not picked up by the patients. The pharmacist will be able to select and access and update the prescription status by hyper linking to the 'Update Prescription Status Page'.

![Prescription List Page]

Figure 27. View Prescription List Page

4.3.17 Pharmacist Update Prescription Status Page

This page will allow the pharmacist to update prescription status and input his/her employee identification number into the prescription order.
**Update Prescription Status**

<table>
<thead>
<tr>
<th>Prescription Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Medication Name: Atorvastatin</td>
</tr>
<tr>
<td>Dose: 10 mg tablet</td>
</tr>
<tr>
<td>Dispense: 7</td>

Figure 34. Logout Page
CHAPTER FIVE

CONCLUSIONS

5.1 Summary

Included in Chapter Five was a presentation of the conclusions gleamed as a result of completing the project. The Prescription Express System applies the newest technology to create a communication network between wireless network of Pocket PC devices and wired network of the hospital server; this communication network provides the functional, manageable and easy-to-use approach for all hospital employees. The PE system integrates the systems for the doctor office, nurse station, and pharmacy department in the same hospital. This system enables the registered hospital doctors to write up a prescription via a Pocket PC device or any networked hospital computer. The prescription can be printed out and save in the central secured hospital server via a wireless or wired network. The system will also automatic transmit the prescription order to the hospital’s pharmacy store in the patient’s request. Then the pharmacy store can immediately process the order and respond back to the medical doctor with a confirmation and the medication pickup time. This system eliminates medical errors resulting from misinterpreted
handwriting. In addition, the system will provide the patients with easy express services without carrying paper prescription and making multiple trips to the pharmacy department.

5.2 Concluding Remarks

Pocket PC along with properly structured content can positively affect how doctors care for their patients. The PE system serves as a model for clinical prescription practices; current prescription information awareness and convenient and secure prescription ordering can be pushed to the wireless handheld device where it is appropriate. And all of this can be integrated with the full power of wireless and web-based resources and technology. The current prototype of PE system is developed with the Microsoft visual development tool kits. All sources will be organized using development packages. This structure will aid in maintaining all modules organized and therefore maximizing maintenance facility. However, because of the limitations of Pocket PC Emulation device and the support of technologies, there are still many limitation encountered in software development.

The software design is extremely critical to usability. It is important to identify the functionality
that is available from the Pocket PC system before designing the software, the outcome of the system will be more likely to have high usability. Is there a mechanism for centralized groupware access? What about software management, data synchronization, and dynamic content? How is internal administrator support managed? All of those factors play important roles in the usability of PE system.

For the future development suggestion, the wireless side project will be able to integrate the system with different handheld devices. On the web based side of project, more features can be added to the client side; in such, the clients can check their medical history or refill status at the comfort of their home computer.

At the current stage of technology, PDAs are designed to work with, rather than replacing laptop and desktop computers. The implication of a Pocket PC application is to provide user to accomplish a specific task. As the demonstration of this project, the future looks bright for Pocket PC in the medical field. The Pocket PC will be used not only to help increasing the efficiency of physicians in practice, but also help to elevate the level of patient care.
APPENDIX A

SAMPLE PRESCRIPTION FORM
This prescription can be filled at the hospital pharmacy or at a community pharmacy.
