ACKNOWLEDGEMENTS

This project was carried out under the supervision and guidance of Dr. Keith Schubert, from the Department of Computer Science, California State University, San Bernardino. I wish to thank Dr. Keith Schubert, my advisor, for his encouragement, support and guidance all along; Dr. Yasha Karant and Dr. David Turner, committee members of my study, for their valuable suggestions; Ms. Monica Gonzales, Mr. Kwon Soo Han, and Mr. Nam Kim from the Department, for their assistance and helps over the years.
ABSTRACT

"Chinese Restaurant Online System" (CROS) is a piece of Business to consumer (B2C) e-commerce software, which means it can help businesses to sell the goods to the general public over the Internet. Additionally, the CROS can assist a Chinese restaurant to manage its business over the Web. There are two types of users of the system: the various customers and the staff of the Chinese restaurant. For the customers, with the CROS, they can view information about the restaurant over the Web and order some dishes online after they login to the system as well. For the restaurant, the employees can login to do their duties depending on their sponsored rights. Therefore, the CROS is not only a B2C e-commerce application, but also a kind of business management software.

CHAPTER ONE
INTRODUCTION

Conducting business activities online, in other words, participating in electronic commerce, is known as e-commerce. Today, there are three types of e-commerce: business to consumer, consumer to consumer, and business to business. Business to consumer (B2C) e-commerce consists of the sale of goods to the general public. Any product or service you purchase from a traditional retail store can be purchased on the Internet. For instance, instead of visiting a department store to purchase a DVD player, one can order it directly from the manufacturer's Web site with B2C e-commerce. Transactions can occur instantaneously and globally, therefore B2C e-commerce provides convenience for both the business and the consumer. This project proposed an example how to develop and implement a piece of Web application for a Chinese Restaurant Online System (CROS).

1.1 Purpose of This Project

A lot of specific online applications have been developed and used in almost every field and the businesses have benefited from the use of these applications; however there is almost no specific Web application for Chinese
Restaurants. The purpose of this project is to develop a Chinese Restaurant Online System that can help various Chinese restaurants to extend their businesses. This system will be used by the different users, such as prospective customer, already registered customer, the restaurant chef or waiter, the cashier or operator, the manager, and the system administrator.

1.2 Scope of This Project

This software product will be shortly called CROS, and it will be an online application that caters to two different categories of customers:

A. Prospective customer
B. Already registered customer

It also caters to the other users:

A. Chinese Restaurant Waiter and Chef
B. Chinese Restaurant Cashier or Operator
C. Chinese Restaurant Manager
D. Chinese Restaurant Administrator

Each user will be issued various levels of privileges depending on his or her role. The CROS will attempt to accomplish the following functions:

1. Provide information for future customers who inquire on the Chinese restaurant menu, and order
dishes online based on the menu choices.

2. Provide information for already registered customer on the Chinese restaurant’s menu, and if they are registered to allow them to order dishes online based on the menu choices.

3. Provide the general employee, such as waiter, waitress or chef, the ability to check their schedules and update their personal information.

4. Provide the restaurant cashier or operator a quick and efficient method to process and deal with the customers’ orders in three categories: walk-ins, telephone, and online. Additionally, the cashier will generate the daily sale report that will be checked by the manager.

5. Provide manager a quick and efficient overview of total income in one day, and analyze the details of sale in the daily, monthly, or yearly, the number of orders, and so on. Also, the manager makes the working schedule for the employees.

6. Provide the system administrator access for maintenance of system. He has a high priority right so he can manipulate any kind of data in database, such as modify data, delete data, or add data into the database.
The next chapter will discuss about an overall description of the CROS.
CHAPTER TWO
OVERALL DESCRIPTION

2.1 Product Perspective

Open source has brought a lot more than Linux to the computing world. It has also given us Personal Home Page (PHP) and My Structured Query Language (MySQL). According to Grademe, PHP and MySQL are the world’s best combination for creating data-driven sites. Therefore, the CROS product will be a combination application of PHP and MySQL.

2.1.1 System Interfaces

The Chinese restaurant online system is a 3-tier architecture. The first tier is the Client that displays user interfaces in a Web browser. The middle one is the Web Server running on the Linux Operating System. It uses Apache, which supports PHP, and the CROS resides here. The third tier is the Database Server using MySQL for a relational database management system (RDMS). The CROS database is stored here. The Web Server communicates with the Client using HTTP and with the Database Server via Open Data Base Connectivity (ODBC).
2.1.2 User Interfaces

All user interfaces will be interactive and dynamic. They will allow the users to enter data into the database, or retrieve data from the database for viewing. The user login will determine, based on predetermined privileges, what data the user is allowed to enter and view. Future compatibility with web browser plug-ins can also allow adding additional dynamic and static interfaces such as viewing PDF documents (e.g., Adobe Acrobat Reader plug-in for web browsers).

Each type of user will have different options available to her or him. However the user interface must have a consistent look and feel. The necessary pages are listed in the following section.

2.1.2.1 Home Page. Figure 2 shows the homepage of the
CROS. The page from top to bottom falls into three parts: the header, the content, and the footer.

The header section contains two-row items. In the left side of the first row there is a restaurant logo button. Clicking this button will take a user to the CROS’ homepage (which is initially set to the CROS Home Page). The right side of this row is an ad element, which displays dynamically a friendly welcome slogan. Immediately below the first row, there are five navigational buttons that enable a user to access five corresponding pages. The functions of these buttons are briefly described here. The Home button is used for entering the current page from any other pages; the Menu is an access to the restaurant’s Menu Page; the Sign In/Off button is for Login; Sign UP is designed for a registration, if one would like to become a CROS’ member; and the last button, Tray, allows a user to make a final check on his or her on-line order.

Follow the header section is the content part. It provides a brief overview of the Chinese restaurant to a visitor. In this section, a user can find the specific information in which he or she is interested. The Search panel is designed for a costumer to choose the food items. To do this, one can either fill in the “dish” box with a desirable item, or just click the Search button; the
browser will scroll a list of dishes in the Sub Menu Page. In addition, the Advanced Search hyperlink provides more inquiring options to a costumer. The Categories panel shows a list of categories. A costumer can click the hyperlink of a specific category name to review the dish shown in the Sub Menu Page. In the Information panel, a user can find the restaurant’s address, phone and location with a map. The enlarged map can be viewed by directly clicking on the map. To view clearly the map, one can click directly on the map to get an enlarged map. Alternatively, one can get the driving direction by clicking the hyperlink of 'Map' that links to the Yahoo Driving Guide Page. The “OPEN DAYS” panel shows working hour information. In the “Favorite” panel, some favorite dishes are displayed. If a visitor wants to order one of them, he or she can click a specific dish name. In this case, the user has to login to the system first. A visitor may also enjoy the enlarged picture of the dishes by clicking those images. The “New or Recommendation” panel provides the similar features with the “Favorite” ones.

The footer is located on the bottom area of the page. It includes two-row items. The first row includes five hyperlinks. Their features are the same as the above five-button ones in the header section. In the second row there
are the copyright information and the us hyperlink that allows a user to access the Outlook Express email software. This feature enables a user send some comments to the Webmaster.

**Figure 2. Home Page**

**2.1.2.2 Login Page.** Figure 3 is the Login Page. This page is displayed when a user clicks the Sign In/Off button in the Home Page. The user’s login information determines a type of a user. A new user does not need to be part of the system. The information required is the user’s ID and
Password. The Sign In button will log a user into the system.

Figure 3. Login Page

2.1.2.3 Register Page. Figure 4 is the Register Page. It will show up when a user clicks the Sign Up button in the Home Page. This page provides two information fields that need to be filled for a new user who wants to become a member of the system. The one with asterisk is required. The other is optional. The Register button will insert the user's personal information into database and then take the
user back to the Home page, while the Cancel button will just take the user back to the Home Page.

Figure 4. Register Page

2.1.2.4 Menu Page. Figure 5 is the Menu Page. It is displayed to a user when clicking on the Menu button from the Home Page. This page displays a list of all the dishes provided by the restaurant. All these dishes are hyperlinked to the Dish Detail Page. For a user who has already logged into the system, he or she can click a specific dish name and order it. For a user who has not
signed in, he or she can view a description of a dish by clicking a specific dish image that is hyperlinked to the Dish Image Page.

![Figure 5. Menu Page](image)

2.1.2.5 Tray Page. This page appears right after a member user has just signed in. It presents the user’s personal information and his or her order list if it is available. In the User Information section, the Login ID is linked via hyperlink to the My Info Page, which allows a user to modify his or her personal information. In the Order
section, it will provide a list of the dishes that he or she has just ordered at this time. If it is available, a user can click the specific Edit hyperlink to modify this dish in the Detail Page. The Confirm button allows a user to confirm his or her order. The Last Order hyperlink links to the Last Order Page that allows the user to check last order if available. In addition, for an employee user from the restaurant, the some action buttons will show up below the header section. The number of the buttons will depend on the employee’s role. With them, the restaurant employee can perform his or her duties.
2.1.2.6 Member Grid Page. This page is displayed for the manager or administrator when he or she login to the system by clicking Member button. It provides a full member record list for the user. In the Search section, the user can quickly find some member records by entering data into the text box and then clicking the Search button. In the Member section, the user can click a column title hyperlink to get a sorted member record list. Additionally, the hyperlink Insert will link to the Member Record Page if the user wants to add more members into the database.
2.1.1.7 Dish Detail Page. This page will display when customer who has logged into the system clicks a specific Dish Name hyperlink in the Menu Page. It provides the dish detailed description. The customer can enter correlated data and then click Adding Dish on Tray button to finish his or her order. This button will take him or her to the Tray Page.
2.1.1.8 Customer Order Record Page. This page will allow the cashier to help the customer to order his or her dishes.
Figure 9. Customer Order Record Page

2.1.1.9 Make Schedule Record Page. This page will allow the manager to make the working schedule for the staff.
2.1.1.10 Analysis Page. This page will allow the manager to view various analysis reports.
2.1.1.11 Customer Information Page. This page will allow the cashier or operator to check the specific customer’s order summary and status. It is displayed for the cashier when he or she clicks an Invoice ID hyperlink in the Check Order Page. It provides the order information based on the data provided by the customer or cashier. The cashier clicks the customer ID to link his or her Customer Record Page to modify the customer data. The cashier can click the Confirm Order to link the Confirm Record Page in order to finish his customer’s order. The hyperlink Add
Dishes links to Customer Order Record Page. The cashier can go to the Customer Order Record Page when he or she clicks hyperlink Edit. Also, the cashier can go to Confirm Invoice Page to help the customer confirm his invoice by clicking the hyperlink Pay Order.

Figure 12. Customer Information Page

2.1.2.12 Make Schedule Page. This page is displayed for the employee when he or she clicks the Make Schedules button in the Tray Page. It provides the working schedule for the employee. The employee can check a next week’s
schedule if it exists. The hyperlink Edit will show up if the user is manager. He or she can go to Schedule Record Page in order to modify schedule for his or her worker by clicking the Edit hyperlink. The manager can also click on hyperlink Add New to go to Schedule Record Page. When the employee is chef, waiter, waitress, or cashier, or other worker, Edit and Add New hyperlinks will not appear because he or she has not right to modify this data.

Figure 13. Make Schedule Page
2.1.3 Hardware Interfaces

CROS will not need any specific hardware interface. The only requirement is that a networking card has to be connected to the Internet to obtain the information. The hardware interface should be supported by any operating system.

2.1.4 Communication Interfaces

The HTTP is used as the communication interface for Internet. In addition, ODBC is used as the other communication interface between database and the software product.

2.1.5 Database Interfaces

MySQL database will be added for the server system. Once the database has been created, interfaces can access the database through PHP using ODBC. Information got will be shown out using PHP and HTML tags.

2.1.6 Memory Constraints

CROS system would not need any new software installations. As a thumb rule, more memory would improve the performance.

2.1.7 Operations

CROS would be running on the web server. The whole system would be available anytime to all user categories. Once the data is updated to the system it would be
consistently available to any user using the system.

2.1.8 Site Adaptation Requirement

No specific on-site requirement is necessary. We assume that the user would use any kind of Web browser that would be available to access the system.

2.2 Product Functions

Figure 14 shows the Use case diagrams that graphically depict the users and the principle functions of CROS.
Figure 14. Use Case Diagram for Users
2.3 User Characteristics

The users of the CROS would fall into one of the following groups:

2.3.1 Customer

The users in this group are two kinds of customers including prospective customer and currently existing customer looking for information about the order. The user will not need a login to access the system. All the information would be provided in an interactive manner for the customer to plan out the order and to get an idea on order needed as their specific requirements. Also, the users in this group can order some dishes online according to their specific requirements.

2.3.2 Staff

The user in this group is the staff, such as waiter, waitress, and chef, etc, of the Chinese restaurant. The user will be able to login to the system and view working schedule, modify personal information.

2.3.3 Cashier or Operator

The user in this group is a cashier or operator of the Chinese restaurant. The user will be able to login to access the system and search order information, search order, add order, modify order by the customer requirements and generate a daily sale report. In addition, like the
staff, he or she can also view the work schedule and modify personal information.

2.3.4 Manager

The user in this group is the manager of the Chinese restaurant. The user will be able to login to the system and make working schedule, check order, generate report, and modify all member personal information except administrator one.

2.3.5 Administrator

The user in this group is the administrator of the CROS or any other employee appointed by the boss to perform the duties. The user will be able to login to the system and add data, delete data, modify data, and backup database.

2.4 Assumptions and Dependencies

In this environment, we assume there are no network connectivity problems. Furthermore, we assume there is no hardware resource limitation. We are assuming that a Web Browser such as Microsoft Internet Explorer, Opera, Konqueror, and Mozilla is available on the client system. Also, we assume no problems associated with the web server or the database server.
2.5 Design Constraints

CROS shall employ the following as a minimum:

- CROS shall have a GUI.
- CROS shall use client/server architecture.
- CROS shall use an internal database for storage of information.
- CROS shall employ software interfaces as lay out in section 2.1, external interfaces.

2.5.1 Standards Compliance

CROS will comply with:

- Customization for needs of a customer and staff.
- Rules and regulations of the Chinese restaurant.
- The information presented will be correct and usable by the potential users.

2.6 Software System Attributes

The CROS will run as an application on a web server and communicate with client’s browser through the HTTP protocol.

2.6.1 Reliability

The CROS will be designed to be a highly robust online system. Errors will be trapped and appropriate messages will be displayed.
2.6.2 Availability

The CROS will be available as a published web address. The component will remain available at that address, except when the systems administrator takes the system down for maintenance purposes.
CHAPTER THREE
DATABASE DESIGN

Previous chapter of this project briefly described an overview of the CROS. This chapter will focus on database design. In order to accommodate the information needs of the users in an organization for a defined set of application, the database design falls five sequential steps phases: requirements collection and analysis, database schema conceptual model, choice of a Database Management System, database schema logical model, and data type and details. The following sections will describe them respectively.

3.1 Requirement Collections and Analysis

The goals of database design are to satisfy the information content requirements of the specified users and applications. To meet the CROS requirements, the data collection depends on the properties of the CROS. Its data mainly consists of members, items, and orders. In the member data, it contains some necessary information, such as member_id, creat_time, pay_type, member_level, etc. For the item data, it needs some relevant information, such as item_id, name, category_id, etc. In the order data, it
includes order_id, member_id, item_id, creat_time, etc. The other data, in addition, is also necessary to meet the CROS requirements. For instance, editorial_categories, editorials, open hours, schedules, etc. Using php scripts will check all of the data when the associated user interface page is submitted to the server. CROS database schema will describe further in the following section.

3.2 Database Schema Conceptual Model
-Entity-Relationship Diagram

Entity-Relationship Diagram can illustrate the entity types and relationship types by displaying their extensions. Figure 15 is an ER Diagram for CROS. It displays the individual entities and relationships instances.

3.3 Choice of a Database Management System

The choice of a Database Management System (DBMS) is governed by various factors, such technical, economic, etc. For the small business such as the Chinese restaurant, MySQL is a good choice. Because it is cheap, lightweight and fast database and it also supports PHP. These are great news for the small business, such as a small Chinese restaurant, developing small-scale client/server
applications that cannot afford to purchase one of the commercially available products.

Figure 15. Entity-Relationship Diagram
3.4 Database Schema Logical Model – Relational Schema

Figure 16. Database Relational Schema

According to the Entity-Relationship Diagram above, all entities and their attributes are mapped into the relational tables. They are illustrated in figure 16.
3.5 Data Type and Details

The logical model establishes the following detailed design in MySQL database. The following tables describe data type, length, primary key, null, default, and extra information, such as auto_increment (AI).

Table 1. Structure of Table Card_types

<table>
<thead>

CHAPTER FOUR
SYSTEM VALIDATION

To run CROS properly, testing system is very important. This chapter will discuss the system validation by the following sections.

4.1 Unit Testing

Unit test, the basic level of testing, is testing of individual hardware or software units or groups of related units. During the unit testing phase, individual components are tested to ensure that they operate correctly. They can be object, class, program, etc. The unit testing results of CROS are shown in Table 25.

Table 25. Unit Test Results

4.2 Subsystem Testing

Subsystem testing is the next step in the testing process, where all related units from a subsystem do a certain task. Therefore, the subsystem test process is useful for detecting interface errors and specific functions. Table 28 shows subsystem test results in detail.
<table>
<thead>
<tr>
<th>Subsystem</th>
<th>Tests Performed</th>
<th>Results</th>
</tr>
</thead>
</table>
| Authorize subsystem        | • Test if subsystem can get the error message.  
• Make sure the result of authorizing user is correct.  
• Verify the login user information is store in session properly.  
• Check if the saving user login information function stores the user information.  
• Verify the login page redirect to the correct browsing request after the user logs in.  
• Check if users can update their own account properly. | Pass    |
| Data management subsystem  | • Make sure the subsystem checks the user before dealing with add, modify, or delete function.  
• Verify the subsystem check the user privilege before handling the user’s date.  
• Verify if the subsystem show the page related to view user data is the users are the owner. | Pass    |
| Browsing subsystem         | • Check if the subsystem checks for user privilege before showing pages.  
• Verify the page is showing properly after the user click on the page line. | Pass    |
4.3 System Testing

System testing is needed to ensure that every component of a system is operating as it should, and that the system is performing exactly in accordance with the specific local requirements. It is the highest level of testing. During the testing phase, the testing process uses real data to test the system. The data are what the system is intended to manipulate. The CROS system testing steps includes three steps: first integrating all subsystem into CROS; second starting up the entire server which CROS need to run such Apache server and MySQL database server, by using a variety of data runs the CROS to analyze the overall result. The CROS system testing steps as the following:

Table 29. System Test Results

<table>
<thead>
<tr>

<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install CROS system into Web server</td>
<td>Pass</td>
</tr>
<tr>
<td>Start up Apache server and MySQL database server.</td>
<td>Pass</td>
</tr>
<tr>
<td>Running testing by using real data on all forms and reports.</td>
<td>Pass</td>
</tr>
</tbody>
</table>
CHAPTER FIVE
MAINTENANCE MANUAL

5.1 Software Installation

In order to run CROS, the six packages will need to be installed properly in advance. They are Red Hat Linux 9, Apache, PHP, MySql, and Open Database Connectivity (ODBC). The following sections will explain their installation steps respectively.

5.1.1 Red Hat Installation

To run CROS, the first task is to choose an operating system. In this case, we pick Red Hat Linux 9.0 as our server platform. Its installation steps describe as following:

The hardware compatibility and disk space are particularly important before installation. Make sure a server installation require 850MB for a minimal installation.

Red Hat Linux 9.0 is distributed on 3 CDs. Start by booting the system with the first CD in the drive, making sure the bios is set to boot from CD before other devices.

Follow the install wizard and sets up the required information such as network setting and the hardware environment.
After configure and select individual the necessary packages, then install it, the machine will need to restart after Installation Redhat is done.

5.1.2 Install Apache

In order to install Apache, first log in as ‘root’. After login, extract the sourceballs by typing the following commands:

```
# tar -zxf httpd-2.0.48.tar.gz
# tar -zxf mysql-4.0.16.tar.gz
# tar -zxf php-4.3.4.tar.gz
```

The commands above will extract the sourceballs into their own separate directories. Now let's move on to compiling the source into usable programs. We'll start with Apache.

Change into the directory created when you untarred the sourceball as follows:

```
# cd httpd-2.0.48
```

Follow this command by typing:

```
#./configure -prefix=/usr/local/apache2 -enable-mods-shared=most (enter)
# make
# make install
```

Apache is installed with the exception of a few minor changes we still need to make. So issue the following
commands:
#vi /usr/local/apache2/conf/httpd.conf
LoadModule php4_module modules/libphp4.so
DirectoryIndex index.html index.html.var index.php
AddType application/x-httpd-php .php
Now we save the file and we are done with Apache.

5.1.3 Install My Structured Query Language

To install My Structured Query Language (MySQL), you also need to run the follow commands as ‘root’. First change into the MySQL source directory as follows:
#cd mysql-4.0.16

Follow these commands by typing:
#./configure --prefix=/usr/local/mysql --localstatedir=/usr/local/mysql/data --disable-maintainer-mode --with-mysqld-user=mysql --enable-large-files-without-debug
#make
#make install

MySQL is installed, and then we need to create a group for MySQL as follows:
#/usr/sbin/groupadd mysql

And create a user called mysql which belongs to the mysql group:
#/usr/sbin/useradd -g mysql mysql
Now we install the database files as follows:

```
#. /scripts/mysql_install_db
```

Then we make a couple minor ownership changes:

```
# chown -R root:mysql /usr/local/mysql
# chown -R mysql:mysql /usr/local/mysql/data
```

Last but not least, we use add a line the ld.so.conf file as follows:

```
#vi /etc/ld.so.conf
```

And we add the following line:

```
/usr/local/mysql/lib/mysql
```

Now MySQL is installed, we can run it by issuing the following command:

```
#/usr/local/mysql/bin/mysqld_safe -user=mysql &
```

And as long as we're here we might as well set a root password for MySQL as follows:

```
#/usr/local/mysql/bin/mysqladmin -u root password new_password
```

Where "new_password" is the password we want to use.

5.1.4 Install Personal Home Page

Like installing MySQL step, you also need a 'root' right to install Personal Home Page (PHP). Go into the PHP source directory as follows:

```
#cd php-4.3.4
```

Follow these commands by typing:
# make
# make install
# cp php.ini-recommended /usr/local/php/lib/php.ini

Then edit that file;
# vi /usr/local/php/lib/php.ini

And change the following:

Find the "doc_root" section and enter the correct path for the directory which serves your web content, such as:

doc_root= "/usr/local/apache2/htdocs/"

(this is default for apache2)

Then find the file_uploads section and change it to reflect the following:

file_uploads=Off

So we are done for PHP.

5.1.5 Install Open Database Connectivity

iODBC is a library of functions that implements the Open Database Connectivity (ODBC) protocol. It is manly used to database engines running on Microsoft Windows. In the Linux operating system, the installation ODBC is
optional, so we skip it.

5.2 Backup and Restore

Backup is very important for maintaining the system. Once the operating system fails, the backup files will play a main role for recovering the system.

5.2.1 System Backup

Assume all CROS system files are located in the directory"/www". We can type the following command to do system backup.

```
tar -cf www.tar /www
```

In the future, we can use the www.tar to restore the CROS system.

5.2.2 Database Backup

To backup the database system, we can use the following command to backup the database:

```
mysqldump CROS | gzip > crosdb.zip
```

After done the command above, the file crosdb.zip would be the backup file of the database.

5.2.3 System Restore

To restore the CROS system file, we can type the following command:

```
#tar -xvf www.tar /
```

Now all CROS system files will restore into the
directory /www.

5.2.4 Database Restore

To restore the database, we can issue the following commands:

mysqladmin create CROS

cat www/*.sql | mysql CROS

mysqlimport CROS www/*.txt

Now the database is restored to the database system.
CHAPTER SIX

CONCLUSION AND FUTURE DIRECTIONS

6.1 Conclusion

CROS is a more function Web application for the Chinese restaurant. It can provide an efficient communication environment for the consumer and Chinese restaurant over the Internet. With it, the consumer can order some dishes and view some information from the Chinese restaurant Web site. For the restaurant, the employee can efficiently use the CROS to run the business. For instance, the Chinese restaurant staff can use it to process some services and manage the business. Just about service consumer order from a traditional storefront also can be ordered on the Internet. Meanwhile it is also a useful management tool for Chinese restaurant. With the CROS, the operator can efficiently process the orders. The manager can use it to manage the business since it can automatically generate some period sale and analysis reports. With the CROS, transactions and management can occur instantaneously and globally, thereby saving time for both the consumer and business.
6.2 Future Directions

The CROS is designed to implement a stand-alone Chinese restaurant to run its business online. However, for the other restaurants rather than the Chinese ones, their business rules and regulations are very similar with Chinese ones. Therefore, by slightly modifying the CROS, it will be able to be reused in various restaurants rather than limiting Chinese restaurant business.

In addition, there are a lot of chain fast foot restaurants across the state, how to modify the stand-alone CROS to implement a chain restaurant online system will should be a main consideration issue in the future.
